OPERATION AND MAINTENANCE MANUAL

DARTRON INDUSTRIES, INC.

2725 19th Street S.E.
P.O. Box 13114
Salem, OR 97309

(503) 362-2341

T A B L E O F C O N T E N T S

INTRODUCTION

This manual is intended to be used as a general guide for the operation and maintenance of your ride. Dartron Industries, Inc. is constantly striving to improve performance, efficiency and safety; therefore, certain improvements may not be reflected in the text of the manual. Any major revisions or additions to the manual will be sent to you free of charge. Specially engineered features purchased for individual rides may not be incorporated in this manual.

MANUFACTURER'S LIMITED WARRANTY

Dartron Industries, Inc. warrants that purchased property is free from all defects in material and workmanship at the date of delivery and for 90 days thereafter. Dartron Industries, Inc. does not warrant that purchased property will meet or exceed federal, state and local design criteria or electrical codes. Dartron Industries, Inc.'s liability is hereby limited to the repair or replacement of any equipment, accessory or part which is defective due to material failure or workmanship. The cost of returning defective parts to Dartron Industries, Inc. and the cost of transportation of repaired or replaced parts to Purchaser shall be born by Purchaser. Dartron Industries, Inc. shall not be liable for down time or loss of operating revenue or any other commercial consequential damages. Losses resulting from improper maintenance or failure to observe Dartron Industries, Inc.'s operating instructions are expressly excluded from this warranty. Purchaser hereby acknowledges receipt of current operating, maintenance and erection instructions, a copy of which is attached to this agreement and made a part hereof.

It is expressly understood between Dartron Industries, Inc. and Purchaser that all warranty is void and Dartron Industries, Inc. disclaims any and all liability or responsibility for failure, loss or damage if device is assembled, maintained or operated other than as recommended in the Manual provided with each device or is loaded or operated in excess of the operator's operating criteria set out in the appropriate manual.

THIS WARRANTY, AND THE OBLIGATIONS AND LIABILITIES OF DARTRON INDUSTRIES, INC. HEREUNDER ARE IN LIEU OF ALL OTHER WARRANTIES, GUARANTEES, CONDITIONS OR LIABILITIES, EXPRESSED OR IMPLIED, INCLUDING WARRANTIES OR MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE AND SHALL NOT BE EXTENDED, ALTERED OR VARIED EXCEPT BY WRITTEN INSTRUMENT SIGNED BY DARTRON INDUSTRIES, INC. AND PURCHASER.

SPECIFICATIONS

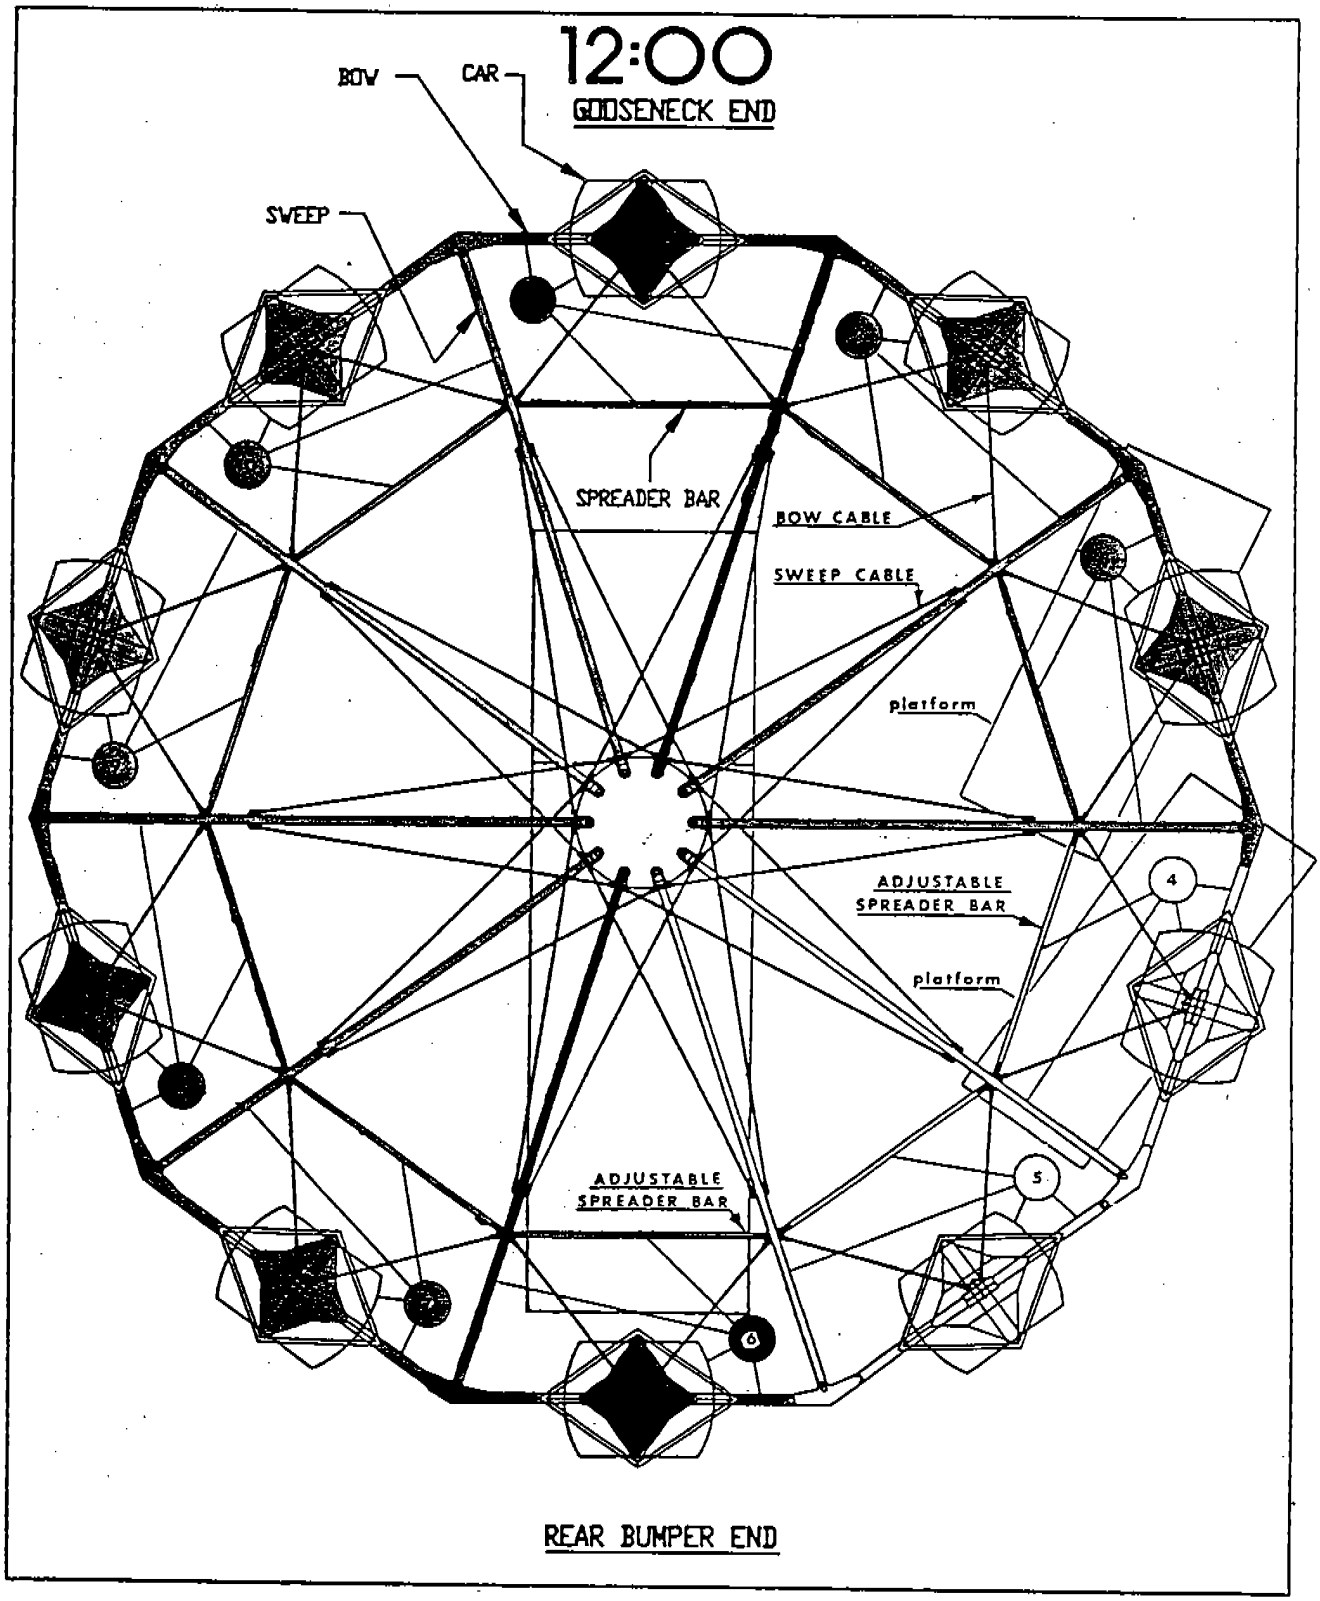
SEATING	Ten cars for 4 adults or 6 children
LIGHTING	Turbo lights - 10 watt bulbs
TOTAL POWER REQUIRED	100 kw
POWERED BY	50 hp, 1750 rpm, TEFC motor
MAXIMUM OPERATING HEIGHT	36 feet, 4 inches
SPACE REQUIRED	53 feet by 57 feet
TRAILER LENGTH	28 feet

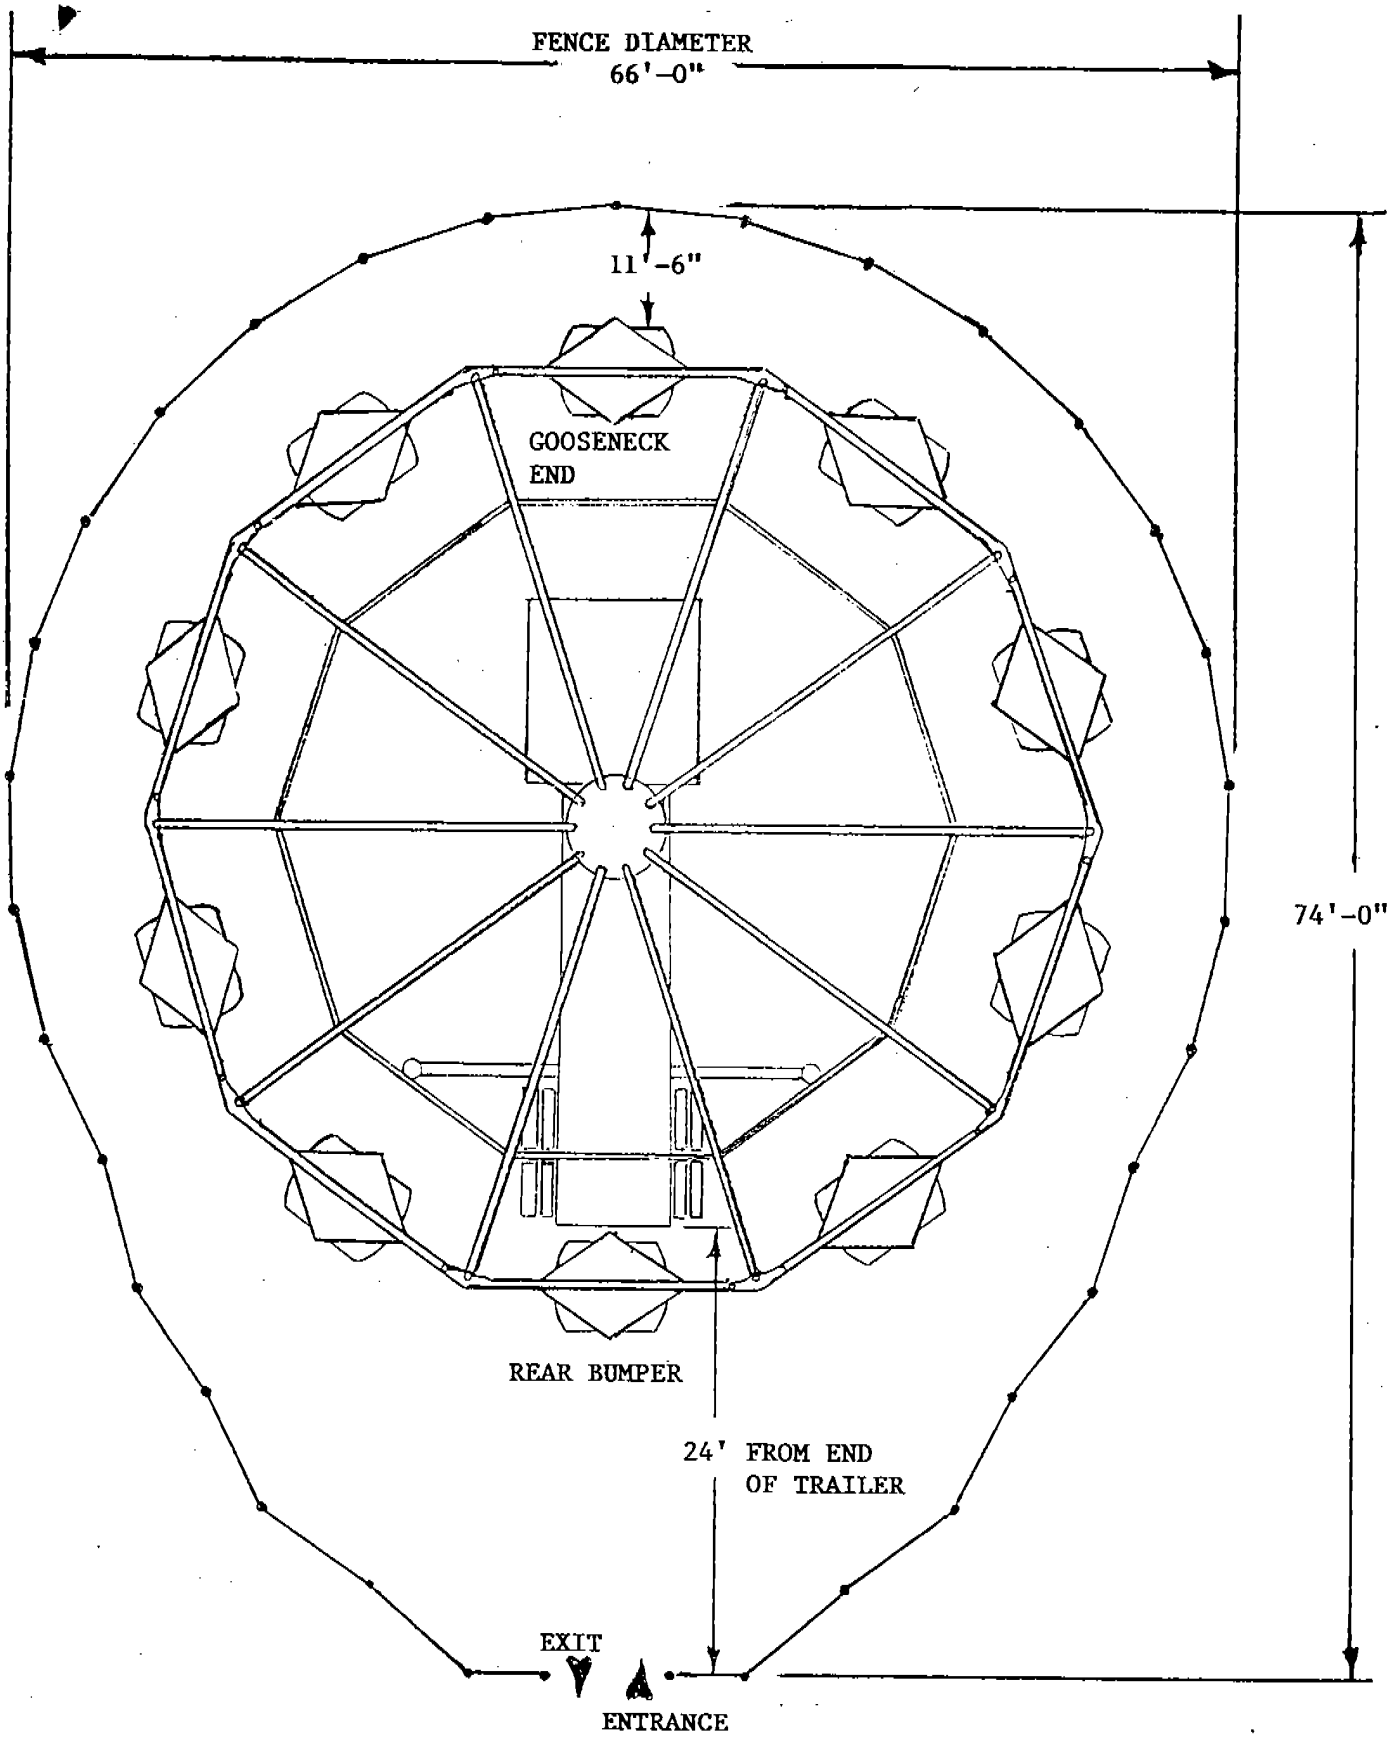
POWER SUPPLY REQUIREMENTS

1. The maximum power needed for the StarTrooper is 100 kw.
2. 210 amps are the maximum required.
3. The StarTrooper requires 220 volt 3 phase <u>with ground</u>.

CAUTION: Failure to supply an adequate ground to the frame can cause serious electric shock hazard. Proper grounding prevents the metal parts of the StarTrooper from being energized (to high voltage) in the event of a short circuit. Another means of grounding is with a ground rod. Check local regulations for ground rod requirements and specifications.

SWEEP, BOW & CAR DIAGRAM





SPACE DIAGRAM

MINUMUM SPACE REQUIRED

DEPTH-------74'-0"
WIDTH-------66'-0"
HEIGHT------40'-0"

QUANTITY OF FENCE

30 LONG
2 SHORT

A. SET UP

1. MISCELLANEOUS ITEMS

a. Electrical power is required to set up StarTrooper. Connect 3 phase 5 wire electrical power.

b. SET UP OPERATOR'S CONTROL STAND. Remove electrical cable for operator's control stand from trailer. Place end of cable at desired location for operator's control stand. Remove operator's control stand, located on the streetside outrigger, and move to the desired location. Connect electrical cord to bottom of operator's control stand.

c. LEVEL AND SUPPORT TRAILER. Using rear landing gear, raise the trailer until weight is transferred to landing gear. CAUTION: DO NOT LIFT TIRES OFF GROUND. Level trailer using front and rear landing gear.

Place blocks underneath screw jacks mounted on rear bumper and lower screw jacks. Screw jacks should be lowered until firmly against the blocks.

Set up rear outriggers by removing pins, rotating outriggers to the open position and pin in place. Remove pins from screw jacks, rotate into position and pin in place. Place blocks underneath outrigger sand shoe and screw sand shoe down until pressure is exerted on blocks.

Maintaining trailer in level position, raise front and rear landing gear so that most of the weight of the ride transfers to rear screw jacks and rear outriggers. Maintain some weight on landing gears.

d. REAR BUMPER. If pintle hook is attached, remove and stow at rear curbside of trailer near landing gear. Push rear bumper in and pin. CAUTION: STARTROOPER MUST NOT BE OPERATED WITH REAR BUMPER IN EXTENDED POSITION. IT MUST BE PUSHED IN.

e. SET UP WHEEL ASSEMBLY PLATFORMS Caution: When removing platforms from possum belly of trailer, lift only one platform at a time. Attempting to lift both platforms could cause injury..

Slide both assembly platforms from the streetside of trailer. Slide platforms partially out of rack, insuring that one side of platform remains supported by possum belly rack, and other side is supported on a board or block so that platform is level.

Remove top platform and carry to position outside the ride circle and place outside where Bow # 3 will be located (see Sweep, Bow & Car diagram, Page 3).

Carry second platform and place outside car circle where Bow # 2 will be located.

Remove fence feet, braces and turnbuckles from second platform and erect the platforms.

f. LOCATE FENCE FEET. Feet, found in platform assembly, are to be located where fence is to be erected (see Diagram, Page 4).

g. SET UP FENCE. Remove fence from rear fenders and install in feet.

h. CHECK ROTATION. Jog motor with START button. Do not start motor. On "C" face flange connected to hydraulic pump is a rotation direction arrow. Fan on electric motor must be rotating in same direction as arrow. If not, switch input leads at generator or main electrical panel.

i. START HYDRAULIC SYSTEM. Be sure rotation switch is in the OFF position. On control stand depress button labeled HYDRAULIC SYSTEM START. See Console Diagram, Page 11.

2. REMOVE 2 CARS FROM GOOSENECK PLATFORM

NOTE: When using hydraulic control levers, located at the rear streetside of gooseneck, to lower cars to the ground, depress override button and hold simultaneously as the lever is being used. **WARNING: BE SURE TO DISCONNECT LOCKING DEVICE ATTACHED TO CAR STORAGE RACK BEFORE LOWERING WITH HYDRAULIC CONTROL LEVER.**

a. Disconnect storage rack safety chain and using the hydraulic control lever and override button, lower car storage rack located on the front of the gooseneck platform until car is slightly above the ground. You must lower front car storage rack before the side racks.

b. Disconnect storage rack safety chain and using the hydraulic control and depressing the override button, lower curbside car storage rack enough to be able to remove Car # 3 (car number is indicated rear of latch on the car). Remove Car # 3 and place outside the circle. After removing Car # 3, lower rack until lowest point touches the ground.

c. Disconnect storage rack safety chain and using the hydraulic control lever, lower the streetside car storage rack enough to be able to remove Car # 10. Remove Car # 10 and place on ground outside the circle. Lower car rack until lowest point touches the ground.

Leave remaining 8 cars on the rack until ready to hang on bows.

3. SPREAD SWEEPS AROUND HUB IN A CIRCLE

a. See diagram for sweep, car, bow numbering and 12:00 orientation.

b. Remove bar brace from between Sweep # 1 and boom. Store bar

on side of boom. Remove bar brace from between Sweep # 10 and boom. Store bar on side of boom.

c. The sweep support beam supports all sweeps while in the travel position. Lower sweep support beam by turning crank of gear jack, located on the streetside. Remove support beam from jacks and store under rear axle of trailer.

d. Rotate Sweeps # 9, 10, 1 and 2 from the rear of trailer to the front gooseneck platform. Once Sweeps # 9, 10, 1 and 2 are to the front, move the split hub pivot wings into place and pin bottom hub plate.

Located on the horizontal brace of front car storage rack is a short brace. Swivel this brace to the vertical position. Remove the pin used to prevent movement of the hub during shipment. Rotate hub until Sweep # 1 is directly above brace. Using the hydraulic system, raise front car storage rack until the brace lifts Sweep # 1 about 1 inch. Lifting Sweep # 1 will allow the split hub wing to be pinned to the top hub plate. Rotate the wheel until Sweep # 5 is directly over the short brace and repeat the above operation.

e. Rotate remaining sweeps forward until the hub cables attached to the sweeps become taut.

NOTE: DO NOT ADJUST CABLES. CABLES ARE PREADJUSTED AT THE FACTORY.

4. ASSEMBLE BOWS, SPREADER BARS, BOW CABLES AND SWEEP CABLES

a. Install H brace

1. Move assembly platforms so that one end is positioned under the end of Sweep # 2 and the other end is under the pinned end of the spreader bar on Sweep # 3 (see Sweep, Car & Bow diagram for platform position).

2. Move second assembly platform so that one end is under the end of Sweep # 3 and the other end is under the pinned end of the spreader bar on Sweep # 4.

3. WITH THE BRAKE IN THE OFF POSITION, ROTATE CIRCLE BY HAND. Rotate circle so that Sweep # 4 is at the 3:00 position. Remove the H-brace from the side of Sweep # 10 and install between Sweep # 4 and 5. Remove nuts from H-brace brackets, install brace and replace nuts. CAUTION: NUTS MUST BE INSTALLED ON H BRACKETS. FAILURE TO INSTALL NUTS COULD RESULT IN DAMAGE TO EQUIPMENT AND POSSIBLE INJURY TO SET UP CREW

b. Install Bow # 4

1. Rotate Sweep # 3 to the 3:00 o'clock position. Unpin Bow # 4

from the side of Sweep # 4. Supporting some of the weight of Bow # 4, swing it to a position close to the end of Sweep # 3. Remove Spreader Bar # 4 from the side of Sweep # 4. Install Spreader bar # 4 between Sweeps # 3 and 4.

2. Remove I brace from the side of Sweep # 10. Install I brace between Sweeps # 3 and 4. I brace installs next to the plate gusset at the end of the sweep.

3. Unpin Bow # 3 from the side of Sweep # 3. Swing Bow # 3 to a position close to the end of Sweep # 2. While one man supports the end of Bow # 3, the other man aligns and pins Bow # 4 to end of Bow # 3. Place R-key in the end of bow pin.

4. Remove I brace from between Sweeps # 3 and 4. Install I brace between Sweeps # 2 and 3.

5. Unattached bow cables are located at the end of sweeps between the plate gussets. Remove unattached bow cables and attach to center of bow using tapered pin.

   Detach hub cable from storing position on sweep 4 and pin at operating position on sweep 4 using tapered pin. Insert R-Key.

c. INSTALL BOW # 3

1. Rotate Sweep # 2 to the 3:00 o'clock position. Remove Spreader Bar # 3 from the side of Sweep # 3. Install Spreader Bar # 3 between Sweeps # 2 and 3.

2. Unpin Bow # 2 from the side of Sweep # 2 and swing it to a position close to the end of Sweep # 1. One person should lift the end of Bow # 2 while another person aligns and pins Bow # 3 to the end of Bow # 2. Place R key in the end of bow pin.

3. Remove I brace from between Sweep #2 and 3. Install I brace between Sweeps # 1 and 2.

4. Remove unattached bow cables and attach to center of bow using tapered pin.

   Detach hub cable from storing position on sweep 3 and pin at operating position on sweep 3 using tapered pin. Insert R-Key.

d. INSTALL BOW # 2

1. Rotate Sweep # 1 to the 3:00 o'clock position. Remove Spreader Bar # 2 from the side of Sweep # 2. Install Spreader Bar # 2 between Sweeps # 1 and 2.

2. Unpin Bow # 1 from the side of Sweep # 1 and swing it to a position close to the end of Sweep # 10. One person should lift the end of Bow # 1 while another person aligns and pins Bow # 2 into the end of Bow # 1. Place R key in the end of Bow pin.

3. Remove I brace from between Sweep #1 and 2. Install I brace between Sweeps # 10 and 1.

4. Remove unattached bow cables and attach to center of bow using tapered pin.

   Detach hub cable from storing position on sweep 2 and pin at operating position on sweep 2 using tapered pin. Insert R-Key.

e. INSTALL BOWS # 10, 9, 8, 7, 6

1. Install Bows # 10, 9, 8, 7 and 6 as explained in B, C and D above.

f. INSTALL BOW # 5

1. Rotate Sweep # 5 to the 3:00 o'clock position. Remove Spreader Bar # 6 from the side of Sweep # 6. Install Spreader Bar # 6 between Sweeps # 6 and 5.

2. Remove H brace from between Sweeps # 4 and 5. Store H brace under trailer.

3. Unpin Bow # 5 from the side of Sweep # 5 and swing it to a position close to the end of Sweep # 4. One person should lift the end of Bow # 5 while another person aligns and pins Bow # 6 into the end of Bow # 5. Place R key in the end of Bow pin.

4. Remove I brace from between Sweep #4 and 5 and store under trailer.

5. Align and pin Bow # 5 into the end of Bow # 4. Place R key in the end of bow pin.

6. Remove Spreader Bar # 5 from the side of Sweep # 5. Install Spreader Bar # 5 between Sweeps # 4 and 5.

7. Remove unattached bow cables and attach to center of bow using tapered pin.

8. Detach hub cable from storing position on Sweep # 5 and pin at operating position on Sweep # 5 using tapered pin. Insert R-Key.

5. INSTALL BONNETS AND HANGER STEMS

Below is the procedure for installing bonnets and car hanger stems.

a. Remove long legs from one assembly platform and replace with shorter 9" legs. Place assembly platform with 9" legs directly to the rear of the trailer underneath the center of the bow. Use platform to install bonnets and hanger stems.

b. INSTALL BONNET. Remove bonnet from storage rack at rear of trailer. Insert 12 volt car electrical cord through round hole in top of bonnet. Install bonnet on hanger block at the center of the bow by inserting two pins. Climb up on fender of trailer and connect electrical plug to top of bonnet.

c. INSTALL CAR HANGER STEM. Remove stem from outrigger and install on hanger block. Position safety strap on lower part of hanger block. Swing shock absorbers down from the bonnet frame to the stem and pin with retaining pin and R-key that are in the bonnet frame. Install small pins through safety straps.

d. Plug wire, hanging through bonnet, into the receptacle at top of stem.

e. After bonnet and hanger stem are installed, rotate wheel so that the next car hanger block is located directly over the platform. Complete the above procedures until all bonnets and car hanger stems are installed.

f. Remove the retaining bracket that the bonnets were stored on and store under trailer.

6. INSTALL CARS ON HANGER STEMS

a. Remove car from car storage rack and install on car hanger stem. Place pin through car hanger stem and car frame and insert R keys in pin and pipe collar to hold pin in place.

b. The safety chain attached to the car frame should be inserted into the slotted hole found in the car hanger stem. Be sure that a link is inserted into the slotted portion of the hole.

c. Pull electrical plug located on the top of the car out enough to be able to plug cord into electrical receptacle found in car hanger stem.

d. Pull pins from headrests, rotate headrests to upright position and pin in place.

e. Repeat the above procedure until all cars are installed.

f. Lower front car storage rack until it rests on the ground.

7. INSTALL SAND SHOES AND TURNBUCKLES on car storage racks.

   a. Remove sand shoes from curbside and streetside outriggers. Raise curbside and streetside car storage racks and install sand shoes on the ends of these racks.

   b. Lower storage racks to the ground by using hydraulic lever control located on streetside rear gooseneck platform.

   c. Install turnbuckle rods between the sand shoe and a loop located under gooseneck platform. Turnbuckle rods are located near the main boom racked on top of each of the mainframe trusses.

   d. Pin one end of turnbuckle to outrigger and the other end to the loops located under the gooseneck. Tighten turnbuckle until taut.

8. INSTALL BALLY SKIRT

   Remove skirt from storage compartment found at rear streetside of gooseneck platform. Install on trailer.

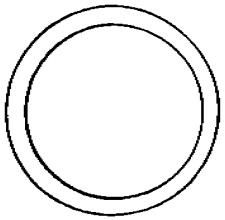
PULL STOP

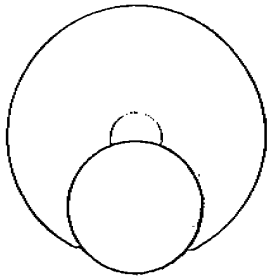
HYD. SYSTEM

BOOM CONTROL

STOP

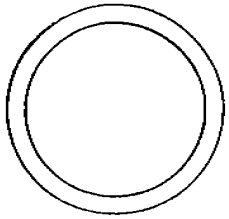


UP



DOWN

JOG



OPERATE W/ BRAKE ON

AND ROTATION SELECTED

Startrooper

CONTROL CONSOLE

The JOG button will override the BRAKE, allowing rotation. When the JOG button is released, the BRAKE will be applied.

When ride is loaded and ready to be operated, place the BRAKE in the OFF position and select rotation direction.

LOADING MUST BE PERFORMED IN A MANNER THAT WILL INSURE THAT THE RIDE LOAD IS BALANCED. FAILURE TO BALANCE THE LOAD COULD CAUSE THE WHEEL TO BE INCAPABLE OF ROTATING.

c. Interruption of power

If power is interrupted from loss of power source or by pushing EMERGENCY STOP mushroom switch, the wheel will immediately free wheel for several seconds.
To lower boom and unload passengers, a pressure release valve can be opened by rotating valve handle located behind hydraulic reservoir. Opening valve will allow fluid from cylinders to leave cylinders through an orifice, lowering the ride slowly to the unload position.

CAUTION: AFTER OPENING VALVE, BOOM CANNOT BE RAISED UNTIL VALVE HAS BEEN CLOSED.

d. Emergency stop

To stop the ride quickly push in the handle labeled EMERGENCY STOP. The ride will stop as explained in Interruption of Power above.

To restart ride the main breaker must be reset and the EMERGENCY STOP handle must be pulled out. After these two events occur, the ride can be restarted.

B. OPERATING INSTRUCTIONS

1. Push button labeled HYDRAULIC SYSTEM START. Operate hydraulic system with no load until hydraulic pump operates quietly. The temperature of the hydraulic fluid should be above 50 degrees before applying load.

   a. Ride operation in the SINGLE-SHOT loading mode.

   CAUTION: WHEEL SHOULD NEVER BE ROTATED WHILE THE WHEEL IS AT GROUND LEVEL. ROTATING THE WHEEL AT GROUND LEVEL COULD CAUSE INJURY TO PASSENGERS OR DAMAGE TO EQUIPMENT. ELECTRONIC CIRCUITRY PROHIBITS THE WHEEL FROM ROTATING UNTIL BOOM HAS RISEN TO A PRE-SET POSITION ABOVE THE GROUND.

   Place switch labeled ROTATION in either the FORWARD or REVERSE position.

   Move joy stick to the UP position. Wheel will rise to a pre-set position and stop, and wheel will begin to rotate.

   Keep joy stick handle to the UP position. Boom will not rise immediately because a timer delays upward movement until adequate rotation speed is achieved. A pre-set rotation speed is achieved. The boom will continue to rise until it reaches its maximum height and will stop. Operator does not need to stop the boom's upward travel.

   Allow wheel to rotate until the buzzer in the control console sounds. Then place ROTATION switch in the opposite position. Ride will stop gently and start rotating in the opposite direction.

   The buzzer will sound again. Turn ROTATION switch to STOP and immediately place joy stick in DOWN position. Boom will lower and then stop at a position several feet above the trailer. The boom will remain at that position several seconds to allow wheel rotation to stop. Keep the joy stick in the DOWN position. After a short pause the boom will continue its downward travel until it rests against its stop. After boom downward movement stops, release joy stick.

   b. Operating ride in the wheel upright mode

   Start and load the ride as in 1.a. above.

   Move assembly platform with 9" legs installed to a position underneath the lowest car directly to the rear of the trailer. The lowest car on the wheel will be loaded and unloaded from this platform.

   To load the ride use the JOG and BRAKE buttons to position the car over the center of the loading platform. Place the BRAKE in the ON position. Select the direction of rotation and push the JOG button.

RACKING

Prepare to rack ride.

1. Leave power connected to ride.

2. Remove turnbuckle rods and sand shoes from car storage racks. Store one sand shoe on each rear outrigger. Stow turnbuckles on pins welded to the main frame trusses near boom.

3. Rotate ride until junction for the two split hubs is in the center of the gooseneck platform.

4. Remove bonnet retaining bracket from underneath rear axle of trailer. Insert into tube found above rear bumper and pin in place.

Remove Cars

1. Remove Cars # 3 and # 10 and place on ground outside of circle.

2. Remove the remaining cars and place on car storage racks. Replace in original positions.

Remove Car Hanger Stems and Bonnets

1. Place assembly platform with 9" legs under car hanger stem to the rear of trailer.

2. As explained in the assembly instructions, remove all car hanger stems and bonnets.

Disassemble Wheel

1. STOW BOWS

   a. Move assembly platforms so that one end is positioned under the end of Sweep # 2 and the other end is under the pinned end of the spreader bar on Sweep # 3 (see Sweep, Car & Bow diagram for platform position).

   b. Move second assembly platform so that one end is under the end of Sweep # 3 and the other end is under the pinned end of the spreader bar on Sweep # 4.

   c. Stow Bow # 5

      1. Rotate Sweep # 5 to the 3:00 position.

      2. Remove bow cables from bow and stow bow cable at end of sweep between plate gussets. Pin to ring welded to the top of the sweep.

3. Unpin hub cable from spreader bar attaching bracket. Remove only the hub cable pinned with an R key. Do not remove hub cables pinned with cotter keys. Pin end of cable in ring welded on lower beam of sweep located toward the hub.

4. Remove spreader bar # 5. Stow spreader bar # 5 on side of Sweep # 5.

5. Remove I brace from underneath the trailer and install between Sweep # 5 and Sweep # 6.

6. Remove pin that connects Bow 5 to Bow 4.

7. Remove pin that connects Bow # 6 to Bow # 5.

8. Swing Bow # 5 inward until it touches Sweep # 5 and pin to Sweep # 5. Car and bonnet electrical cords should be wrapped around bonnet plugs and tied tightly to sweep to insure that cords do not swing away from sweeps during transit.

9. Remove the H-brace from underneath the trailer and install between Sweep # 4 and 5. Remove nuts from H-brace brackets, install brace and replace nuts. CAUTION: NUTS MUST BE INSTALLED ON H BRACKETS. FAILURE TO INSTALL NUTS COULD RESULT IN DAMAGE TO EQUIPMENT AND POSSIBLE INJURY TO SET UP CREW

d. Stow Bow # 6

1. Rotate Sweep # 6 to the 3:00 position.

2. Remove I brace from between Sweeps 5 and 6 and install between Sweep # 6 and Sweep # 7.

3. Remove bow cables from bow and stow bow cable at end of sweep between plate gussets. Pin to ring welded to the top of the sweep.

4. Unpin hub cable from spreader bar attaching bracket. Remove only the hub cable pinned with an R key. Do not remove hub cables pinned with cotter keys. Pin end of cable in ring welded on lower beam of sweep located toward the hub.

5. Remove spreader bar # 6. Stow spreader bar # 6 on side of Sweep # 6.

6. Remove pin that connects Bow # 7 to Bow # 6.

7. Swing Bow # 6 inward until it touches Sweep # 6 and pin to Sweep # 6.

e. Stow Bows # 7, 8, 9, 10, 1, 2, 3, and 4 in the same method.

f. Remove I brace and H brace and stow on the side of Sweep # 10.

2. STOW SWEEPS TO REAR OF TRAILER

a. Move to gooseneck platform. Using brace located on front car storage rack, lift Sweeps # 1 and 10, allowing upper hub to pivot wing pins to be removed.

b. Remove sweep support beam from under the trailer and install on top of sweep support beam jacks. Raise jacks until all sweeps are supported on the beam.

c. Use flatbar brace to attach Sweep # 1 to trailer frame. Use second flatbar brace to attach Sweep # 10 to trailer frame.

3. STOW CARS ON GOOSENECK PLATFORM

a. Using hydraulic controls located on rear streetside of gooseneck platform, raise curbside and streetside car storage racks enough to be able to insert Cars # 3 and 10 on prong pointing toward ground. Install Cars # 3 and 10 on prong and pin in place. Raise car storage racks to stowed position on top of gooseneck platform.

b. Using hydraulic controls, raise car storage rack located on the front of the gooseneck platform to its stowed position.

c. Safety chains are located at the base of all car storage racks. Insert a link of the safety chain into the slotted hole in the car storage rack. **TRAILER MUST NOT BE MOVED WITHOUT SAFETY CHAIN IN PLACE AND TIGHT.**

4. STOW MISCELLANEOUS ITEMS

a. Install half of fence on curbside on rear fender and remaining fence on streetside rear fender. Hold in place with brackets located in those positions.

b. Turn both tables upside down and remove legs, braces, and turnbuckles. Carry one table to streetside of ride and insert table open side up in possum belly tracks and prop up other end with blocks. Carry all legs, turnbuckles, braces, and fence feet to table and store in indented areas. Carry second table and install open side down on top of other table. Pin table halves together. Shove into possum belly once outrigger is stowed it will retain the platform in its position.

c. Using rear landing gear, raise the trailer until screw jacks mounted under rear bumper are loose. Screw jacks until they retract fully.

d. Stow rear outriggers by loosening sand shoes, removing pins, rotating screw jacks upward, and pinning in place. Remove pins from rotation points and rotate outriggers against trailer and pin in place. Retract rear landing gear until it is in the travel position and all trailer weight is on the rear tires.

e. Pull rear bumper from its position against the trailer to its travel position and pin in place. If needed, install pintle hook on rear of bumper.

f. Disconnect electrical power. Disconnect power cord from bottom of ride control stand and store. Disconnect power cord from generator and store.

g. Stow ride control stand on streetside outrigger.

LUBRICATION SPECIFICATIONS

1. RECOMMENDED OIL FOR HYDRAULICS

   ATW 46 Hydraulic Fluid

2. LUBRICANT FOR ALL ZERK FITTINGS

   Chevron Ultra Duty Grease EP # 2 or Equivalent

3. LUBRICANT FOR MAIN DRIVE GEAR

   Chevron Open Gear Lube or Equivalent

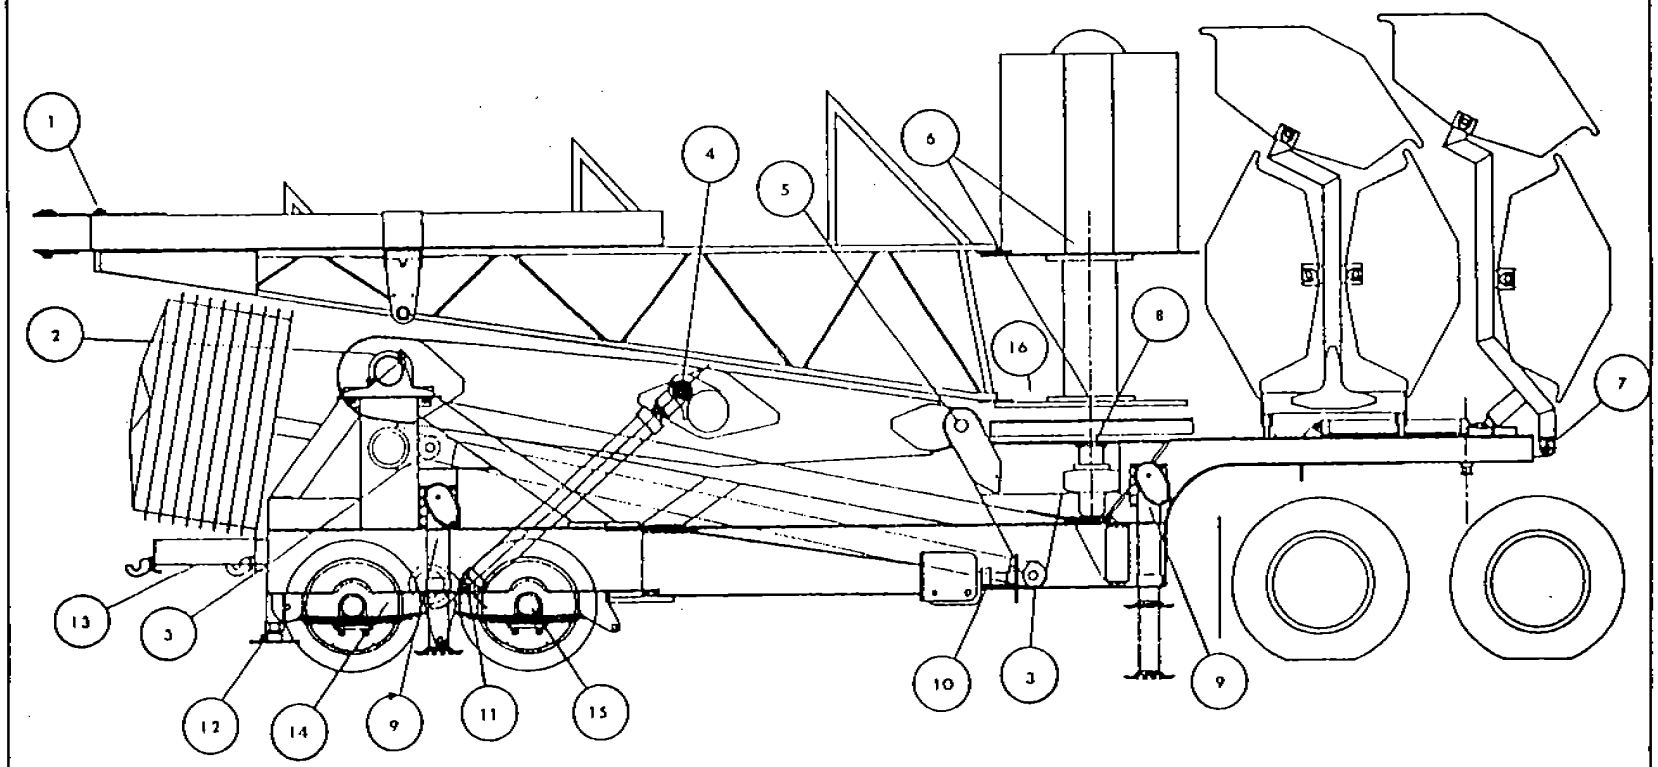
4. PIVOT POINTS WITHOUT GREASE ZERKS

   Multi-purpose machine oil 20 W

LUBRICATION CHART

ITEM	LOCATION	LUBE	FREQUENCY
1	Bow pivot pin	Grease	Monthly
2	Boom pillow block bearings	Grease	Daily
3	Link arm ends	Grease	*Weekly
4	Upper cylinder pin	Grease	Weekly
5	Boom platform pivot pin	Grease	*Weekly
6	Upper & lower center hub bearings	Grease	Weekly
7	Car storage racks	Grease	Monthly
8	Main drive gear	Grease	*Weekly
9	Landing gear	Grease	Monthly
10	Outrigger screw jack	Grease	Monthly
11	Lower cylinder pin	Grease	*Weekly
12	Rear screw jacks	Grease	Weekly
13	Rear bumper	Silicone	Monthly
14	Rear brake slack adjusters	Grease	Monthly
15	Hydraulic Tank	Hyd. fluid	Daily

* Every set up if shorter than one-week interval



STARTROOPER - Lubrication Chart

INSPECTION AND MAINTENANCE CHART

COMPONENT	PERFORM	FREQUENCY
Hydraulic System		
Suction line screens (2) Pressure filters (2)	Clean or change Check Change	Annually Monthly Annually
Hydraulic Oil	Check oil level; add if needed. Replace	Weekly; daily if running constantly Annually
All Grease Points	Grease with specified grease.	See Lube Chart
Car Stem & Car Ass'y	Check for wear on pins Make sure R-Keys, push pin, and safety chains are in place.	Daily
Lap Bar	Open & shut to check latch mechanism. Check lock to make sure it works and catches in two positions.	Daily
Ride Controls on Console	Run ride and check all switches to make sure they are operating correctly.	Daily
Sweep & Bow	Check to see if cables are taunt. Make sure R-keys & cotter keys are in place.	Daily
Cables	Contact manufacturer on cable adjustments.	
Trailer Tires & Axles	Check tires for air pressure and any road damage. Tire pressure is 140 psi cold. Check oil level in axles; add if needed.	Weekly
Commutator Brushes & Rings	Check for wear. Replace as needed	Monthly

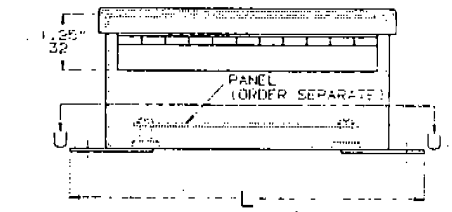
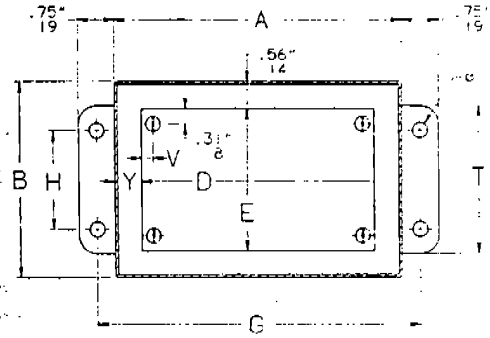
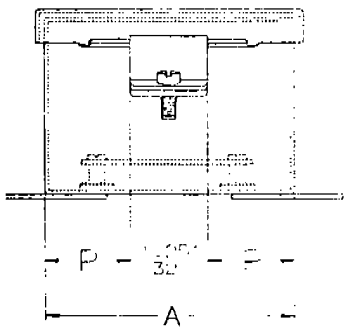
Millimeter dimensions ( ) are for reference only; do not convert metric dimensions to inch. Catalog numbers ending in "S" are hinged on short side.

* Panels must be ordered separately. Optional stainless steel and aluminum panels are available for most sizes. See Accessories.

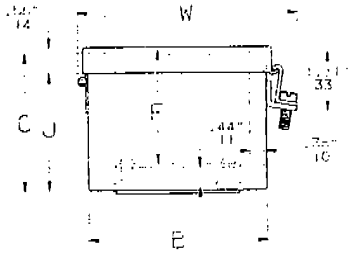




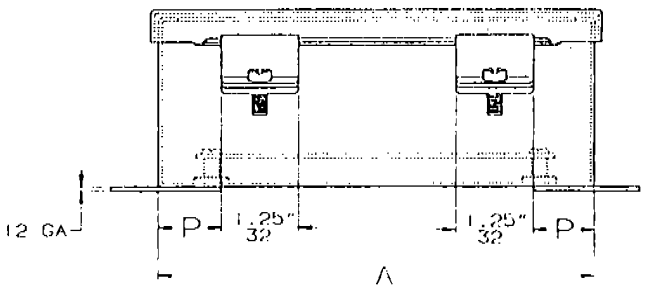
SECTION U-U



View showing clamp end of box when one clamp is used.

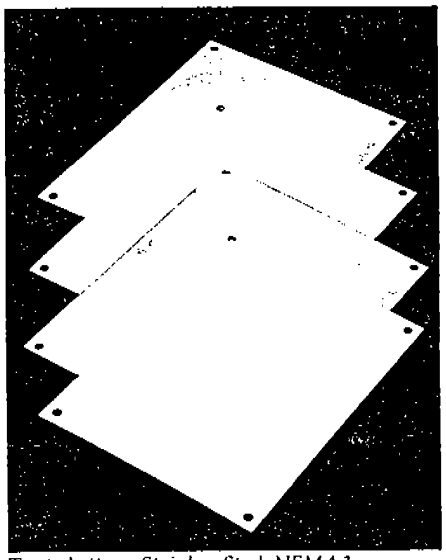


NOTE: 1. Panels are 14 gauge steel.
2. Panel screws are # 10-32 pan head.



View showing clamp end of box when two clamps are used. When B=8.00 (203) or more use two clamps.

Inch
Millimeter



Top to bottom: Stainless Steel, NEMA 1, Aluminum, and Steel panels

Panels for JIC and NEMA 1 Enclosures

Steel panels are 14 gauge and have a white enamel finish.

Stainless steel panels are 14 gauge Type 304 and have a commercial #2B finish which is protected on one side with a plastic film.

Aluminum panels are 5052-H32 aluminum alloy .080-inch (2 millimeters) thick and protected on one side with a plastic film.

Panel mounting hardware is furnished with all enclosures which accept these panels.

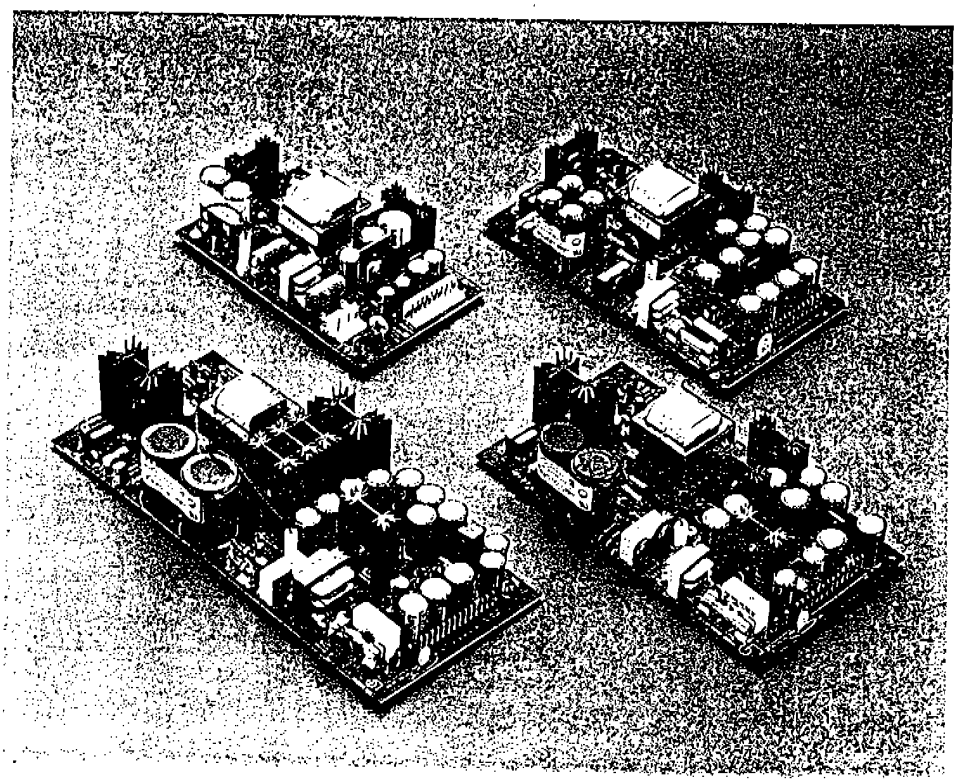
"V" SERIES VALUE LINE



FEATURES

- 19 models . . . 4 power levels . . . 45 to 125 watts
- Multi-output . . . up to 5 outputs
- Clean, low-cost, open-frame design
- VDE, IEC, UL, and CSA approved
- FCC Class A and VDE 0871 Class A conducted EMI filtering
- Industry standard packages with extra power
- Worldwide AC input ranges 90-132/180-264 VAC
- Full load burn-in and 2-year warranty
- High peak current disk drive outputs as well as 3-terminal-type closely regulated outputs
- Extremely versatile output configurations for tough applications

SPECIFICATIONS

AC INPUT: 90-132/180-264 VAC user selectable, 47-63 Hz single phase.

DC OUTPUTS: See output rating chart.

HOLD UP TIME: 20mS minimum @ full load and nominal input voltage.

OUTPUT REGULATION: See output rating chart for individual output regulation ratings. Regulation ratings shown are for combined line and load variations with the line varied from either 90-132 or 180-264 VAC and the load on the output under test varied from 50% to either 20% or 100% with the other loads held constant at 50%.

MINIMUM LOAD: A minimum load is required on the + 5V output to maintain proper operation of the other outputs. VCA series: 0.8A; VFA series: 2A; VHA series: 2.5A; VKA series: 3A. Operation down to no load will not cause damage and the + 5V ouput will generally remain within regulation.

OUTPUT NOISE AND RIPPLE: 0.5% RMS, 1.5% P-P maximum on all outputs.

TRANSIENT RESPONSE: + 5V output only. 1.0 milliseconds typical response time for a 50% to 100% or 100% to 50% load change. Maximum voltage deviation: 6.0%.

TEMPERATURE COEFFICIENT: 0.03% typical for all outputs.

OVERVOLTAGE PROTECTION: Built in on + 5V outputs with firing point set at 6.2V ± 0.6V.

VOLTAGE ADJUSTMENT: Built in potentiometer adjusts voltage from 4.5V to overvoltage firing point (6.2V nominal).

CURRENT LIMIT ADJUSTMENT: Built in potentiometer factory set to begin current limiting at the following peak power outputs minimum under nominal line conditions. VCA series: 65W; VFA series: 130 watts; VHA series: 140 watts; VKA series: 155 watts.

EFFICIENCY: 70% ± 5% depending on model and load distribution. Measured at 100% of rated power.

OVERSHOOT: No output overshoot on turn on or turn off.

OVERLOAD PROTECTION: Fully protected against output overload and short circuit. Automatic recovery after removal of fault.

REVERSE VOLTAGE PROTECTION: All outputs protected against inadvertent application of reverse voltage.

INPUT PROTECTION: Internal AC fuse provided on all units.

INRUSH CURRENT: Inrush current is limited by an internal thermistor for maximum protection of input rectifiers. Peak inrush current averaged over first half cycle = 12A (115 VAC input), 24A (230 VAC input).

TEMPERATURE RATING: 0 to 50 °C at full rated output power with natural convection cooling in a non-restricted environment. For operation in a confined space moving air is recommended. For operation above 50 °C it is important that the cooling vs. loading profile is such that the heat sinks do not operate above 100 °C for extended periods.

	4	- 12V	2.5A	3.0%	4.0%	B

NOTES:

A: Full regulated output. Voltage adjustable from 4.5V to OVP trip point. Initial setting of + 5.0V is ± 1.0%.

B: Quasi-regulated output requires 20% minimum load to meet regulation specs. An additional cross-regulation factor of ± 3% must be added in those applications where the main + 5V output varies ± 25%.

C: Fully regulated output utilizing fixed, 3-terminal regulator.

D: Fully isolated output. May be connected in series with any output, and may be connected for (-) or (+) output. May be paralleled when same output voltage and reg. type. (Quasi-reg. and 3-pin outputs will not share loads if connected together.)

E: Dual-sensed, regulated output. + 5V and + 12V outputs are sensed in combination to provide tighter regulation of the + 12V output. An additional cross-regulation factor ± 2.0% must be added in those applications where the + 5V output varies ± 25%. Initial setting of + 5V output is ± 1.0%.

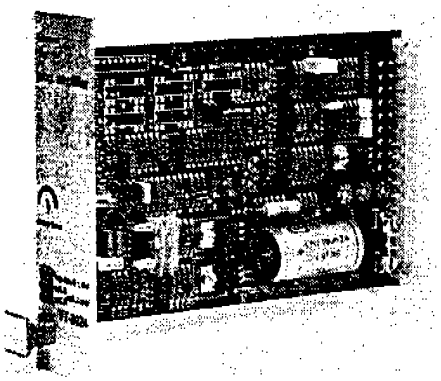
Electronic amplifier type VT 3024, Series 4X for the control of proportional directional valves without spool position feedback

RA
29 938/5.86
(metric)
Replaces: 10.85

Amplifier type VT 3024 is used for controlling directional proportional valves, without spool position feedback.

It basically consists of:

- voltage stabiliser
- ramp generator
- step function generator
- summator
- 2 pulse with modulated output stages
- differential amplifier input



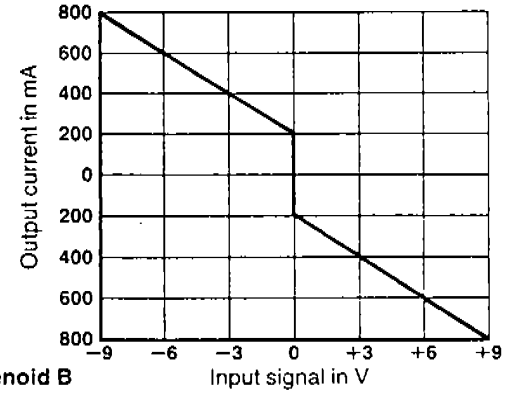
R 85/100
VT 3024 S 4X

Suitable card holders:

- VT 3002-1X, see RE 29916
- VT 1516-1X, see RE 29915
- VT 1700-1X, see RE 29917

Output curve:

Solenoid A



Solenoid B

Technical data:

Supply voltage	(U):	
Full wave rectification		24 V_{eff} ± 10 %
Rectified 3phase supply		28 V_{eff} to 35 V_{eff}
Regulated voltage	(U):	± 9 V with centre tapping
Max. load of controlled voltage	(R):	≥ 500 Ω
Max. coil resistance	(R):	19.5 Ω
Power requirement	(P):	30 VA
Pilot current	(I):	20 mA
Max. output current	(I_{max}):	800 mA
Frequency range (output stage)	(f):	160 to 180 Hz

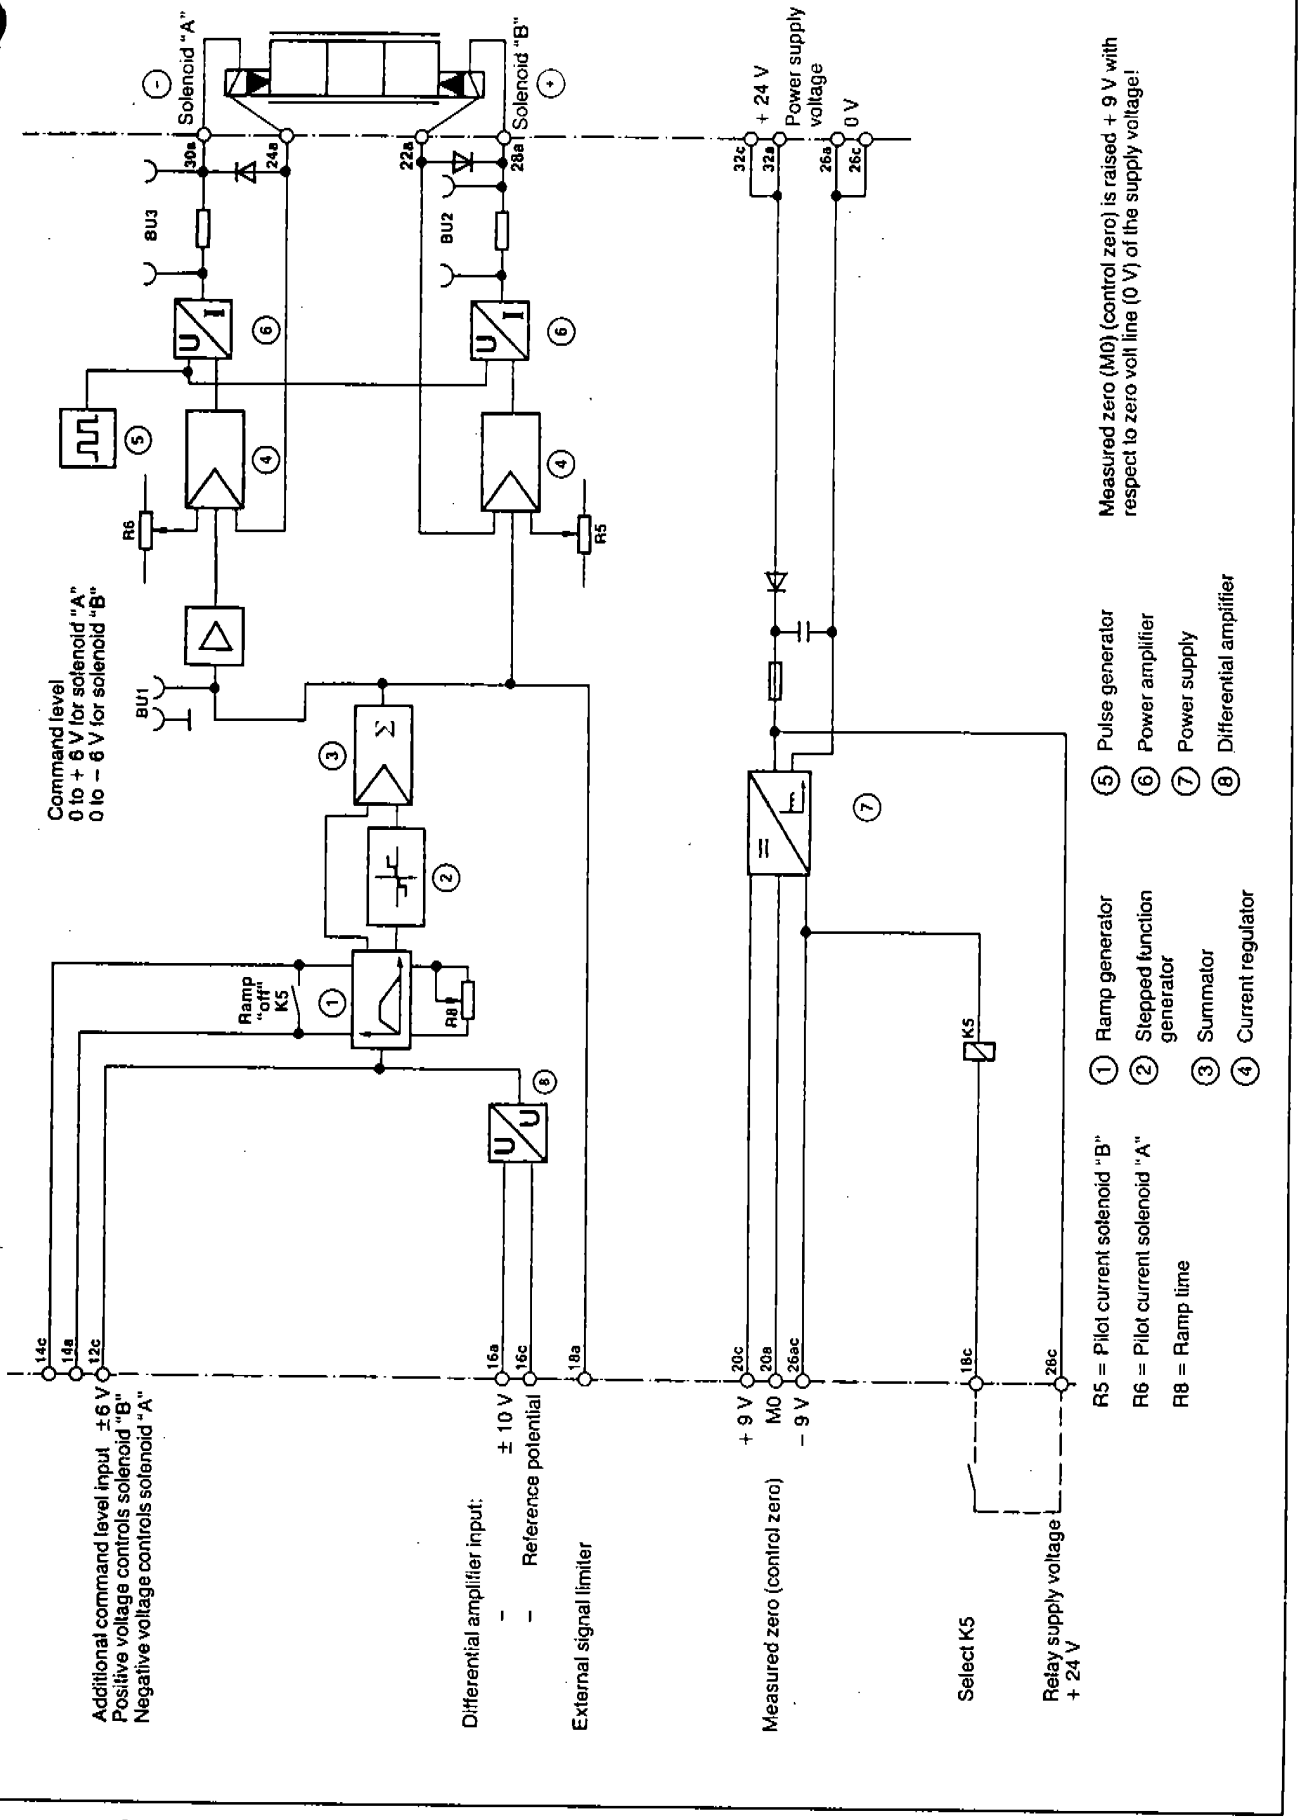
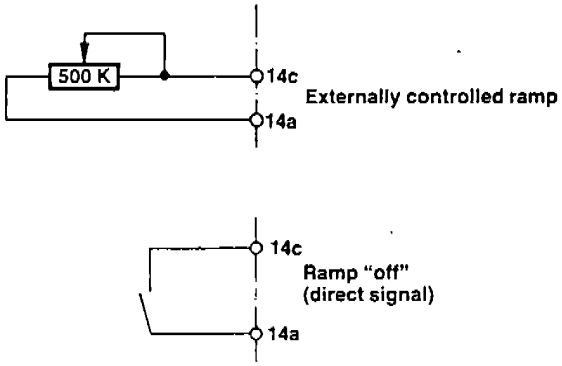
Terminal Connections VT 3024 S 4X



External time potentiometer



Note:

When using an external time potentiometer, the internal ramp time potentiometer must be set to maximum!

Description of function

Amplifier type VT 3024 S 40 has a differential amplifier input (16a - 16c).

The command level voltage is not taken from an internal source, but from an external supply. For this purpose, the differential amplifier input (8) is utilised. When using the differential amplifier input, it is important to note that both connections must be made and broken simultaneously!

The ramp generator (1) converts a stepped input signal into a slowly increasing output signal. The rise time (gradient) of the output signal is set via R8. The ramp time stated can only be achieved over the full voltage range (from 0 to ± 6 V measured at the command level test points).

A command level of ± 10 V at the input of the differential amplifier, develops a voltage of ± 6 V at the test points. If a lower command level than ± 10 V is selected then the ramp time will be correspondingly reduced.

The ramp time can also be set via an external time potentiometer (see external time potentiometer). When using an external potentiometer, the internal potentiometer acts as a limiting value.

The output signal of the ramp generator (1) is passed to the summator (3) and the step function generator (2). The step function generator (2) generates a step function at its output, which is added to the outgoing signal by the summator (3). This step function is included in order to cause the valve to pass through the overlap zone as quickly as possible.

At signal levels below approximately 100 mV, only the step function is transmitted.

The output signal from the summator is then passed to the two output stages with current regulators (4), the pulse generator and the power amplifiers. With a positive signal, at the input of the differential amplifier, solenoid B is energised, whilst a negative signal controls solenoid A.

Ordering code

32 pin linear plug to DIN 41612 Form C = S
(for installation in Euro-magazines or cardholders)

Series 4X = 4X
(40 to 49 ≙ installation and connection dimensions remain unchanged)

Further details in clear text

No desig. = German front plate
E = English front plate

R1 = Ramp time up to 1 sec
R5 = Ramp time up to 5 sec

Additional information

- The amplifier may only be unplugged when switched off!
- Measurements to be made with a high resistance meter set on the DC voltage range!
- Measured (control) zero (M0) is raised + 9 V with respect to 0 V of the power supply!
- M0 may not be connected to 0 V of the power supply!
- Radio transmitters may not be placed within 1 m of this card!
- Command level inputs may only be switched with contacts suitable for currents of < 1 mA!
- Screen all input lines. Leave one end of the screen open. Connect one end to 0 V of the supply line!
- Do not lay solenoid lines close to power lines!
- When using the internal relays, terminal 28c must be used as the power supply line!

THE REXROTH CORPORATION
INDUSTRIAL HYDRAULICS DIVISION P.O. Box 2407, 2315 City Line Road, Bethlehem, PA 18017 Phone (215) 694-8300 Telex: 84-7498
MOBILE HYDRAULICS DIVISION P.O. Box 394, 1700 Old Mansfield Road, Wooster, OH 44691 Phone (216) 263-3300 Telex: 98-6335

SETUP INSTRUCTIONS
VT3024-S-3X/..

REFERENCE DATA SHEET: RA29938

1. CONNECT POWER SUPPLY 24VDC ± 10%

Positive (+) to terminal 32ac
Negative (-) to terminal 26ac

2. CONNECT SOLENOIDS

Solenoid A - terminals 24a and 30a
Solenoid B - terminals 28a and 22a

3. CONNECT INPUT SIGNAL

3a. ANALOG SOURCE (From PLC, Computer)

Connect a ±10V analog signal to the differential input. Use shielded cable.

Solenoid A	Solenoid B
+10v - terminal 16a COM - terminal 16c	-10v - terminal 16a COM - terminal 16c
or	or
COM - terminal 16a -10v - terminal 16c	COM - terminal 16a +10v - terminal 16c

4. RAMP OFF RELAY

Energize relay with 24vdc. Standard contacts may be used, terminal 28c provides a nominal 24v source that is provided by the card. The ramp is disabled when this relay is energized.

Ramp-off coil K5 - terminal 18c

5. ADJUST RAMP

The ramp time potentiometer controls the valve's acceleration and deceleration rate. This pot is located through the faceplate. Turning the ramp potentiometer clockwise will increase ramp time. Standard ranges are 1 second or 5 seconds.

6. TEST POINTS

INPUT: Internal voltage to amplifier stage may be checked across test points BU1, on faceplate, or between terminals 18a and 20a (M0). 6 volts = 100%

0 to +6vdc for solenoid-A
0 to -6vdc for solenoid-B

SOL A: Output to solenoid-A may be tested with a voltmeter across test points BU3. Voltage on meter numerically corresponds to current to solenoid (through 1 ohm test resistor, mV = mA). Typical solenoid current ranges from 30mA to 700mA.

SOL B: Output to solenoid-B may be tested with a voltmeter across test points BU2. Typical solenoid current ranges from 30mA to 700mA.

VT-Patch cords are available from test points to standard jacks. Rexroth 807707 - Red Rexroth 807708 - Black

NOTES:

1. Terminals identified with the suffix 'ac' are internally connected on the VT-card.

2. Do not operate radios within 3 feet of the amplifier card.

3. The signal common or measured zero (M0 - terminal 20a) is not connected to the negative side of 24vdc. This is a floating ground on the card. Do not ground M0.

4. Contacts for switching analog input signals must handle currents under 1 mA. Use dry circuit or sealed contacts.

5. External, analog command lines should be wired with shielded cable. Connect one end of shield to ground. Normally, panel ground is used.

6. Terminals 26a and 26c (26ac) are called -9v with respect to signal common, M0. These same terminals also serves as power supply common (0v). Like psig and psia, the reference points for ±9v and 24vdc are different.

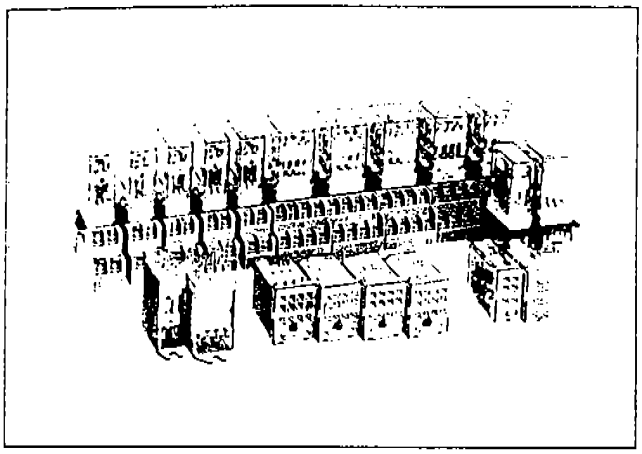
General Purpose "Miniature" Relays
3A Contact Ratings
2 & 4 Form C Bifurcated Contacts



Features

- Compact miniature size saves space
- 2PDT and 4PDT models, available with bifurcated cross-bar contacts, ensure reliable low-current switching for dry circuit applications
- Choice of plug-in/solder or PCB type terminals
- Options include check button for test operation and indicator lights on 4PDT models
- UL recognized and CSA certified
- DIN rail, suface, panel and PCB type sockets avaialble for flexible mounting applications

UL Recognized
File No.E64245
E59804

CSA Certified

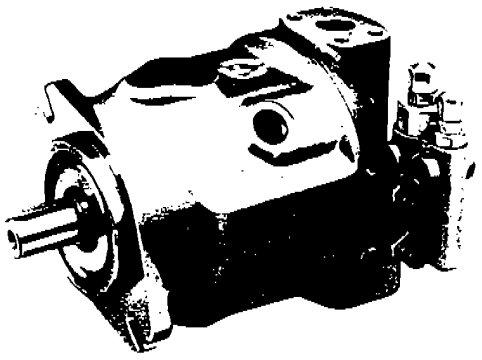
WORLDWIDE HYDRAULICS

Variable Axial Piston Pump, Swashplate Design Model AA10VSO (Series 30) for Open Circuit Applications

Sizes 28 to 100	...4570 PSI (...315 bar)	...6.10 in^3/rev (...100 cm^3/rev)

RA 06 291/06.87

- 2-bolt mounting flange to SAE standards
- SAE flanged connections with UNC threads (SAE J 518)
- Special slot-controlled swashplate design
- High power to weight ratio
- Heavy duty roller bearings for extremely long pump life
- Various control options for pressure. flow and power regulation
- Fast response times and low noise level
- Continuous operating pressure of 3625 PSI (250 bar), peak pressure to 4570 PSI (315 bar)
- Axial and radial loading of the drive shaft possible
- Good self-priming suction characteristics
- Cast iron housing, aluminium free construction
- Operation on water based fluids 95/5 (HFA emulsions) possible with de-rated performance parameters



Functional Description

Axial piston pumps model AA10VSO are swashplate design, variable displacement pumps. They are designed for hydrostatic transmission in open circuit applications. The pump generates fluid flow and imparts to that fluid the necessary pressure forces up to 4570 PSI (250 bar).
They basically consist of the housing (1), cylinder barrel (2), piston and shoes (3), port plate (4), drive shaft (5), swash plate (6), control piston (7), mechanical stroke limiter adjustment (8), shaft seal (9) and compensator control (10).
Rotation of the drive shaft (5) causes a linear piston movement as the piston shoe (3) slides along the tilted swashplate (6).
As the piston retracts in the cylinder bore (2), fluid fills the developing vacuum cavity from the suction port »S« via the suction kidney in valve plate (13). At maximum retraction of the piston, shaft rotation causes the piston to go beyond the suction kidney and begin communication with the pressure kidney. Continuing rotation then extends the piston into the cylinder bore, forcing fluid into the pressure port »B«.
The stroke length of the piston is directly related to the swashplate angle, which swivels up to a maximum of 17 degrees for stepless flow adjustment.

Pressure and flow regulation

The swashplate is normally held at maximum swivel angle by a spring (11) as well as system pressure working on the stroking piston (12).
System pressure is also working on the pressure compensator against a setting spring. When system pressure overcomes the spring force, the spool shifts allowing system pressure into the control piston (7). This causes the pump to destroke to a regulating point sufficient to maintain compensator set pressure and lubricating fluid flow.
When the pressure setting is reached, only the amount of fluid necessary to satisfy the load conditions is delivered. If the load condition is such that no flow is required, only cooling and lubricating fluid is delivered. Power usage and heating of the fluid are thus kept to a minimum.
When system pressure falls below the compensator setting, spring force returns the spool back to its normal position, which drains control piston (7) to the pump case. The swashplate is then forced on stroke by the spring (11) and stroking piston (12). The flow control spool FR, also known as load sensing control, functions generally the same as the compensator spool. In the case of the FR spool, however, its response is due to a differential pressure across a flow control device. The spring setting only determines the differential pressure required to maintain constant output flow through a given orifice size.
Many control options including constant power control, electronic proportional flow and/or pressure control, etc. are available.

Hydraulic Fluid

Before project design, please see our data sheet RA 90220 or RA 90223 for detailed information on the selection of hydraulic fluids and their application limits.

Operating viscosity range:

For optimum efficiency and pump life, we recommend that the operating viscosity (at operating temperature) be selected in the range of

ν_{opt} = optimum operating viscosity
81...167 SUS (16...36 mm²/s)

taking into consideration the reservoir temperature range.

Viscosity limits:

The following values are valid for extreme operating conditions of short duration.

ν_{min} = 60 SUS (10 mm²/s)
for short periods at max. permissible drainage oil temperature of 194° F (90° C)

ν_{max} = 4635 SUS (1000 mm²/s)
for short periods upon cold start up

Example:
VG 22 =
Viscosity grade of 22 centistokes
at 104° F (40° C)

Notes on the selection of the hydraulic fluid:

For correct selection of the hydraulic fluid, it is assumed that the operating temperature in the reservoir (open circuits) in relation to the ambient temperature is known.

The hydraulic fluid should be selected so that, within the operating temperature range, the operating viscosity lies within the optimum range ν_{opt} (see shaded area of selection diagram). We recommend that the higher viscosity grade is selected in each case.

Example: At some ambient temperature of X°, the operating temperature in the reservoir is 140° F (60° C). In the optimum operating viscosity range (ν_{opt}, shaded section), this corresponds to viscosity grades VG 46 or VG 68; VG 68 should be selected.

Important: The drainage fluid temperature is influenced by pressure and speed and is always higher than the reservoir temperature. At no point in the system, however, must the temperature be higher than 194° F (90° C).

If it is not possible to comply with the above conditions because of extreme operating parameters or high ambient temperature, please consult us.

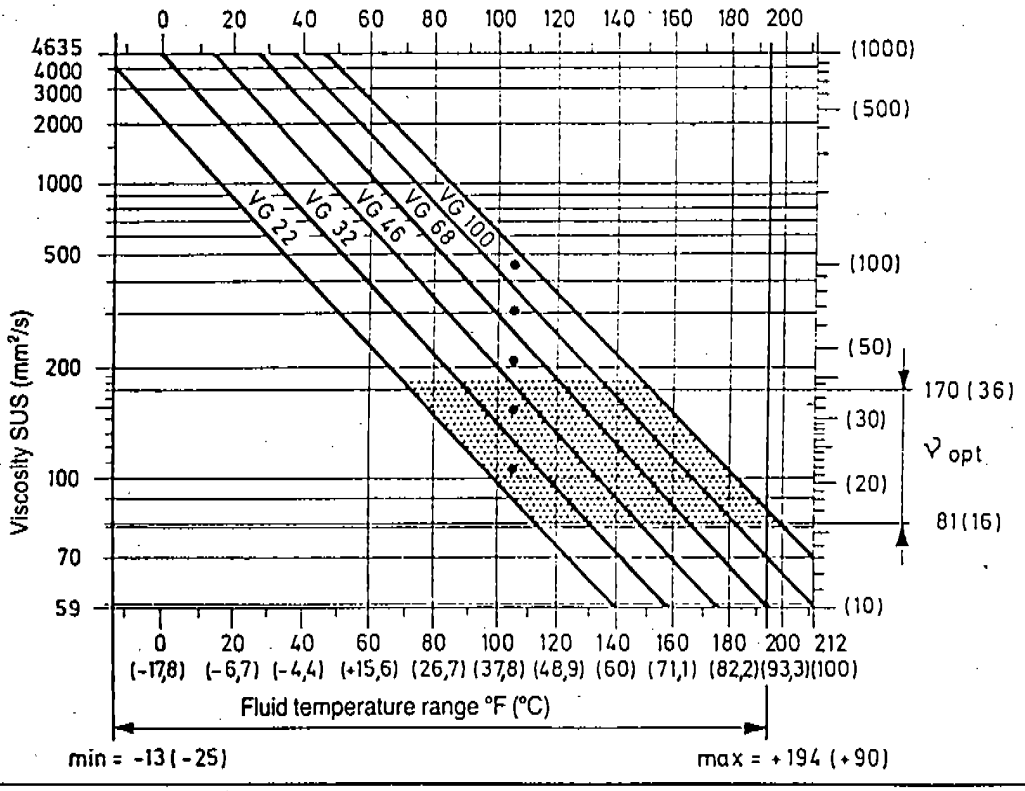
Filtration

In order to guarantee proper and reliable function, the operating fluid must be maintained to a minimum cleanliness grade of 9 to NAS 1638, 6 to SAE, ASTM, AIA or ISO grade 16/15.

This can be achieved, e.g., with filter elements type ... D 020 ... (see RA 31278).

A beta value of $\beta_{20} \geq 100$ is thereby achieved.

Selection Diagram



Technical Data

Values are valid for petroleum oils for water-content and synthetic fluids please see data sheet RA 90223 for detailed fluid information

Operating pressure range – Inlet Side

Absolute pressure at port S (suction inlet)

$p_{abs\ min}$ ——— 12 PSIA (0.8 bar)
$p_{abs\ max}$ ——— 435 PSIA (30 bar)

Operating pressure range – Outlet Side

Pressure at port B

Nominal pressure p_N ——— 3625 PSI (250 bar)
Peak pressure p_{max} ——— 4570 PSI (315 bar)

Drainage fluid:

Maximum permissible pressure of the case drain (port L): 7 PSI (0.5 bar) maximum higher than inlet pressure at port »S«, but not higher than 30 PSI (2 bar) absolute.

Direction of flow:

Port »S« to port »B«

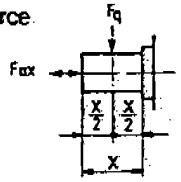
Direction of applied force



Sizing Calculations

Flow $Q = \frac{V_g \cdot n \cdot \eta_v}{231}$ $(Q = \frac{V_g \cdot n \cdot \eta_v}{1000})$

Drive torque $M = \frac{V_g \cdot \Delta p}{24 \cdot \pi \cdot \eta_{mh}}$ $(M = \frac{1.59 \cdot V_g \cdot \Delta p}{100 \cdot \eta_{mh}})$

Drive power $P = \frac{M \cdot n}{5252} = \frac{Q \cdot \Delta p}{1714 \cdot \eta_t}$

$(\frac{2\pi \cdot M \cdot n}{60000} = \frac{M \cdot n}{9549} = \frac{Q \cdot \Delta p}{600 \cdot \eta_t})$

V_g = geom. displacement in³/rev (cm³/rev)
Δp = pressure differential PSI (bar)
M = torque lb-ft (Nm)
Q = flow GPM (l/min)
P = drive power HP (kW)
n = speed rpm
η_v = volumetric efficiency
η_{mh} = mechanical efficiency
η_t = overall efficiency ($\eta_t = \eta_v \cdot \eta_{mh}$)

Mounting position

The unit can be mounted in a number of optional positions. The pump housing must be filled prior to start-up.
In order to achieve optimum noise level values, all connecting lines (suction, pressure and leakage) should be elastically connected to the reservoir.
Check valves in leakage return lines should be avoided. Exceptions are possible, subject to our approval in advance.

1. Vertical installation (shaft pointing upwards)

The following installation parameters should be considered:

1.1 Pump submerged in Reservoir

Prior to installation, the pump should be filled while in a horizontal position.

a) The minimum fluid level must be level with or higher than the pump face flange. Connections »L« + »L_1« should be left open (see illustration #1)

b) If the minimum fluid level is lower than the pump face flange, then connection »L_1« and possibly the suction (»S«) port must be piped, as per Illustration # 2. Conditions as per item 1.2.1. Port »L« is plugged.

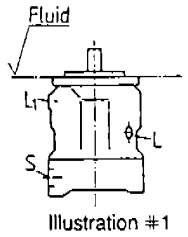


Illustration #1

1.2 Pump mounted outside of Reservoir

Prior to installation, the pump should be filled while in a horizontal position. Above-tank mounting as per Illus. # 2.

1.2.1 Operational paramaters. Minimum pump inlet pressure $p_{e\,min}$ =12 PSI (0.8 bar) under static and dynamic loads.
Note: Avoid above-tank mounting whenever a low noise level is desired.

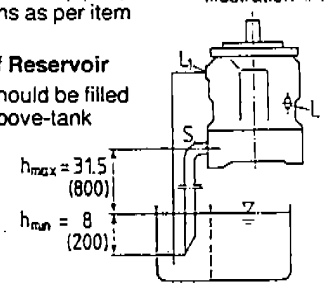

Illustration #2

The allowable suction height is a factor of the total pressure loss; it must, however not be greater than h_{max} = 31.5" (800 mm). Submerged depth $h_{T\,min}$ = 8" (200 mm).

Total Pressure loss $\Delta p_{TOTAL} = \Delta p_1 + \Delta p_2 + \Delta p_3 \leq (1 - p_{E(min)})$ = 2.9 PSI (0.2 bar)
with Δp_1: Pressure loss in piping due to acceleration of the fluid column.

$$\Delta p_1 = \frac{\varrho \cdot l \cdot dv}{dt} \cdot 10^{-5} \text{ (bar)}$$

ϱ = thickness of fluid (kg/m³)
l = pipe length (m)
dv/dt = Suction speed differential (m/s²)

Δp_2: Pressure loss through geographic altitude differences

$$\Delta p_2 = h \cdot \varrho \cdot g \cdot 10^{-5} \text{ (bar)}$$

h = altitude (m)
ϱ = thickness of fluid (kg/m³)
g = acceleration of gravity (9.81 m/s²)

Δp_3: line losses (elbows, etc.)

This calculation is valid for controls DR, DFR, DFLR

2. Horizontal Installation

Installation should be so that port »L« or »L_1« is at the top of the unit.

2.1 Pump submerged in Reservoir

a) The minimum fluid level on the same level as or higher than the unit's upper surface: Connections »L/L_1« and »S« must be open (see illustration #3)

b) The minimum fluid level lower than the unit's upper surface: Connection »L« (or »L_1«) and possibly »S« must be piped, as per Illustration #4. Operating parameters as per Item 1.2.1.

2.2 Pump mounted outside of Reservoir

Pump housing must be filled prior to start up.

a) Above tank mounting as per Illustration #4. Operating parameters as per item 1.2.1.

b) Below tank mounting Ports »L« and »S« must be piped as per Illustration #5

Overall efficiency:

$$\eta_t = \frac{Q \cdot p}{p_{Q\,max} \cdot 1714} \left(\frac{Q \cdot p}{p_{Q\,max} \cdot 600} \right)$$

Volumetric efficiency:

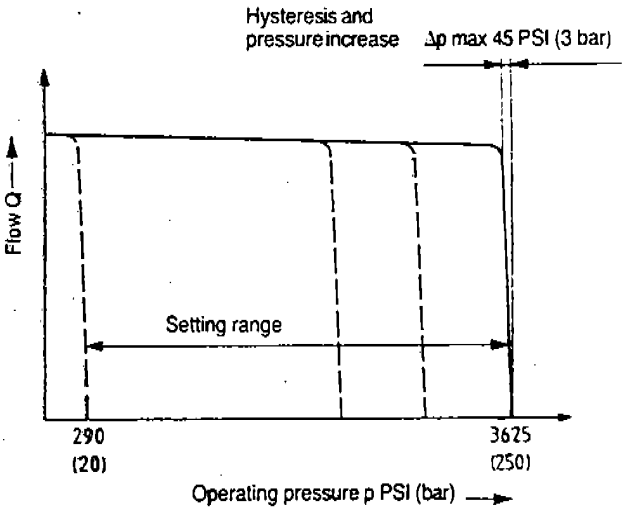
$$\eta_t = \frac{Q}{Q_{theor}}$$

Constant pressure compensator DR

The constant pressure compensator serves to maintain a constant pressure in a hydraulic system, within the control range of the pump. The pump supplies only the amount of hydraulic fluid required. Pressure may be steplessly set at the pilot valve.
Adjustable mechanical flow limiter from $V_{g\,max}$ to 50 % $V_{g\,max}$ only possible on model without through drive (N00).

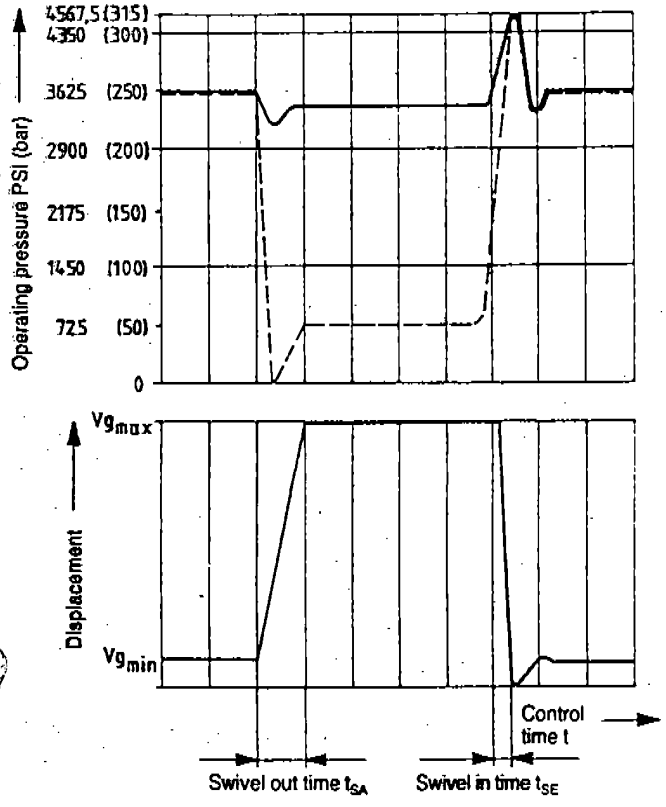
Static operating curve

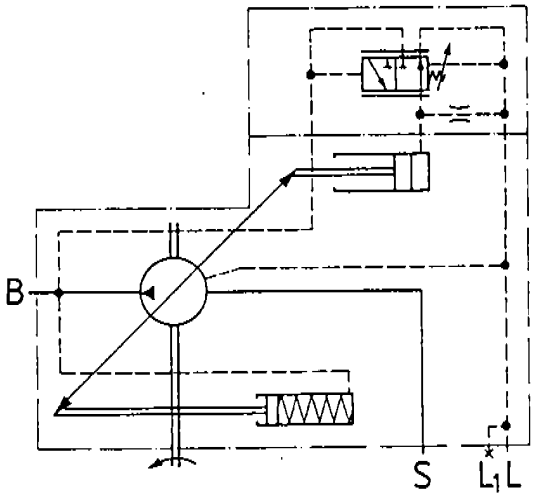
at n_1 = 1500 rpm; t_{oil} = 122° F (50° C)



Dynamic operating curves

Curves are measured average values under testconditions, with unit submerged.
Conditions: n_1 = 1500 rpm;
t_{oil} = 122° F (50° C)
relief set at 4570 PSI (315 bar)
Sudden closing of the pressure line. via relief valve DBD, approx. 3.28 ft (1 m) from the port plate of the pump.





0.80 GPM (3 l/min) pilot flow is required, taken from the high pressure side of the circuit.

Remote pressure control via port X of the flow control valve see page 9.

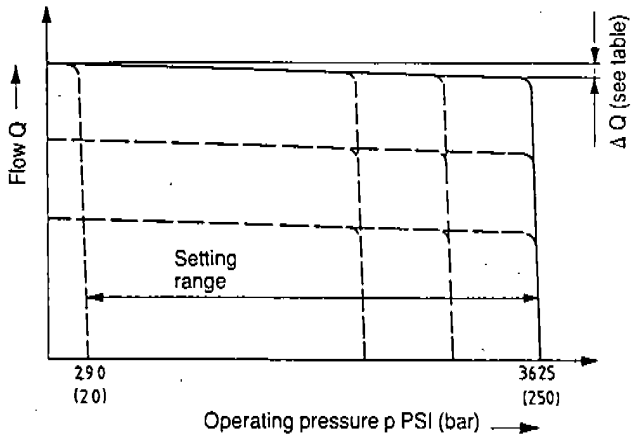
Size	t_{SA} (ms) toward 725 PSI (50 bar)	t_{SA} (ms) toward 3625 PSI (250 bar)	t_{SE} (ms) o-Displacement 3625 PSI (250 bar)
28	60	30	20
45	80	40	20
71	100	50	25
100	200	100	25

Constant pressure/flow compensator DFR

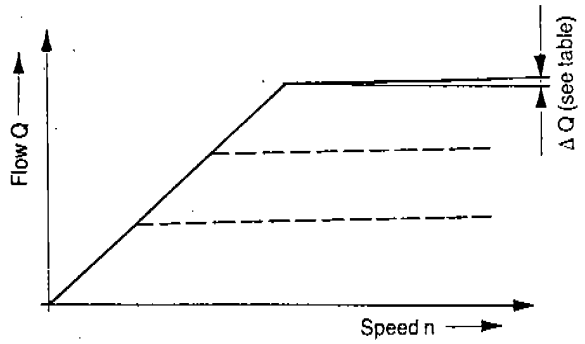
In addition to the constant pressure control, the pump flow may be regulated by means of a differential pressure (e. g. an orifice installed in the service line) »load sensing«. Adjustable mechanical flow limiter from $V_{g\,max}$ to 50 % $V_{g\,max}$ only possible on model without through drive (N00).

Static operating curve

at n_1 = 1500 rpm; t_{oil} = 122° F (50° C)



Static operating curve at variable speed



Max. flow variation

(Hysteresis and increase)
measured at drive speed n = 1500 rpm

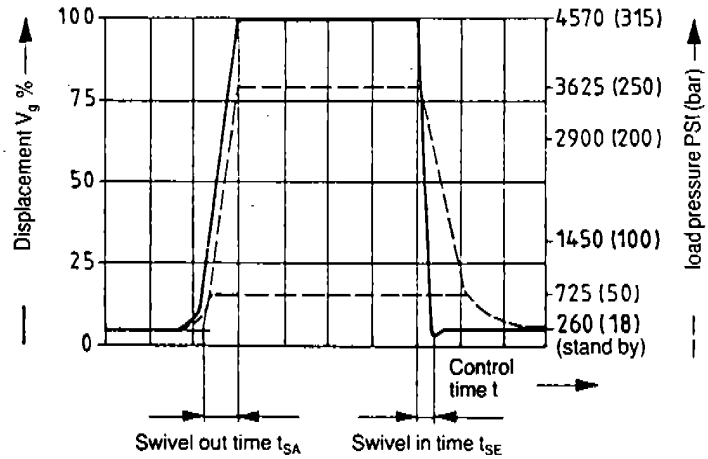
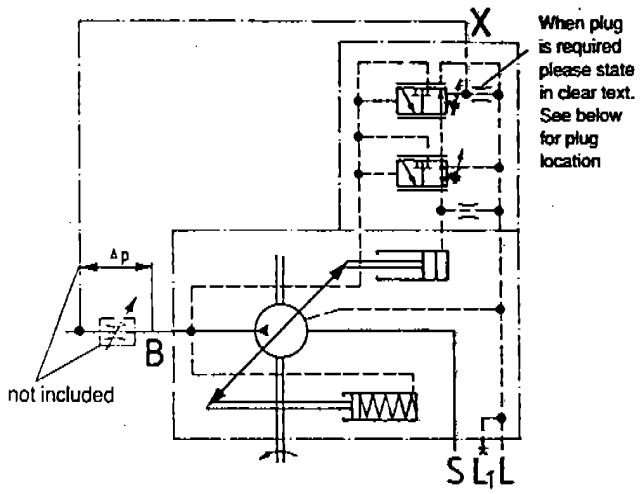
ΔQ	Gpm (l/min)	0.26 (1)	0.48 (1.8)	0.74 (2.8)	1.06 (4.0)

Dynamic operating curve

Curves are measured average values under test conditions, with unit submerged.





A maximum of 1.32 GPM (5 l/min) is required for pilot flow.

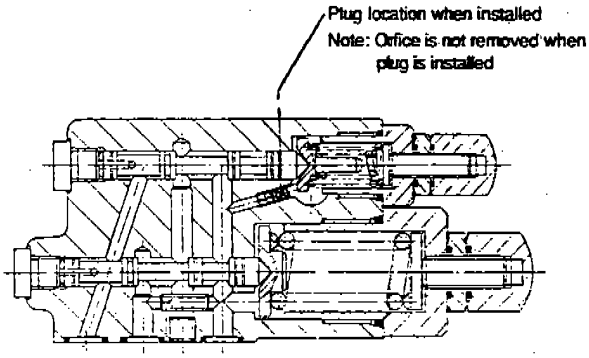
Differential pressure Δp:
settable between 145 and 435 PSI (10 and 30 bar)
standard setting 205 PSI (14 bar)

By unloading port X to tank, a zero stroke (deadhead) pressure of 260 PSI (18 bar) ± 30 PSI (2 bar) is achieved.

Valve options at Port »B«

(not included in pump, to be ordered separately)

Mobile valve block SP 12 (RA 64144)
Mobile valve block SP 18 (RA 64147)
Mobile valve block MP 18 (RA 64594)
Mobile valve block MP 22 (RA 64598)
Proportional valve 4WRE (RA 29060)



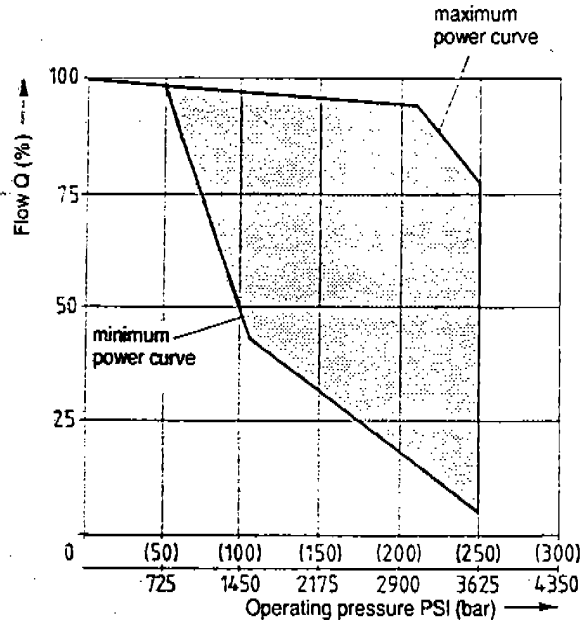
Size	t_{SA} (ms) stand by–250 bar 3625 PSI	t_{SE} (ms) 250 bar–stand by 3625 PSI	t_{SE} 50 bar–stand by 725 PSI
28	40	20	40
45	50	25	50
71	60	30	60
100	120	60	120

Constant pressure/flow/power control DFLR

In order to achieve a constant drive torque with a varying operating pressure, the swivel angle and with it the output flow of the axial piston pump is varied so that the product of flow and pressure remains constant.

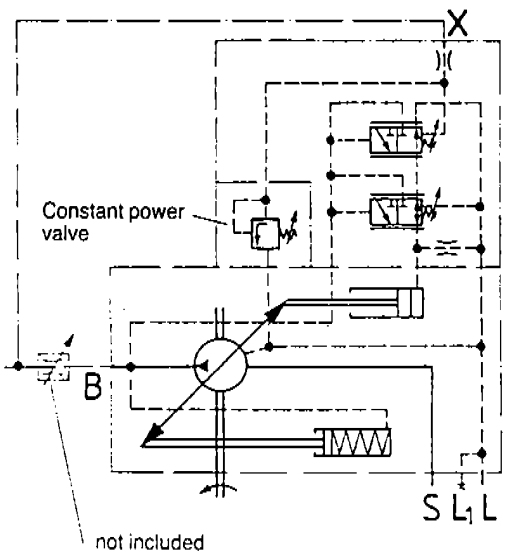
Below the power curve, it is possible to control the output flow.
Adjustable mechanical flow limiter from $V_{g\,max}$ to 50 % $V_{g\,max}$ only possible on model without through drive (N00).

Static operating curve



Begin of regulation at 725 PSI (50 bar)

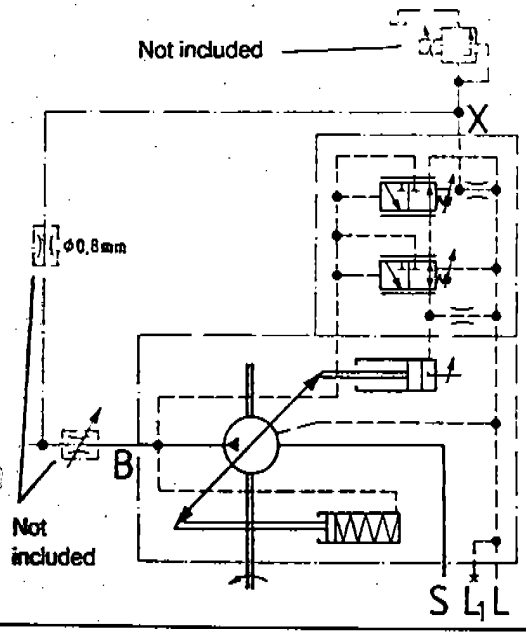
When ordering, please state power setting in clear text, e. g. 7 1/2 HP at 1800 rpm (5 kW at 1500 rpm).



A maximum of 1.45 GPM (5.5 l/min) pilot flow is required.

By unloading port X to tank, a zero stroke (deadhead) pressure of 260 PSI (18 bar) ± 30 PSI (2 bar) is achieved (»stand by«).

Optional remote pressure compensation (by using the DFR valve)



This option is assembled by customer at time of installation. Therefore the pressure relief valve, throttle valve and orifice ø0.031in (ø0.8mm) are not included with the DFR control. As a pressure relief valve we would recommend:

DBDH-6 hydraulic (RA 25 402);
DBET-30 electrical (RA 29 142);
DBETR electrical (RA 29 166).

Note that remote relief valve is used as a pilot on the "X" port of FR valve. So the FR spool must function even if load sensing is not needed.

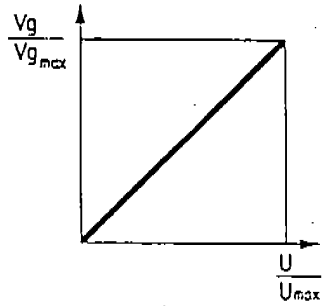
Throttle valve at "B" port is only used to illustrate load sensing or flow control if desired. This throttle is not necessary for proper operation of remote pressure control. The ø0.031in (ø0.8mm) orifice in the sensing line is needed, and must be supplied by the customer.

Max. line length should not exceed 6-1/2 ft (2m).

Electrical flow control FE

The pump displacement is controlled via an electrically operated proportional pilot valve.
The pump position feedback is realized via an inductive positional transducer.
The amplifier card VT 5036 (see page 11 and also RA 29957) regulates the pumpflow. This card is not an integral part of the pump and must be ordered separately.
Adjustable mechanic flow limiter from $V_{g\,max}$ to 50 % $V_{g\,max}$ only possible on model without throughdrive (N00).

Static operating curve

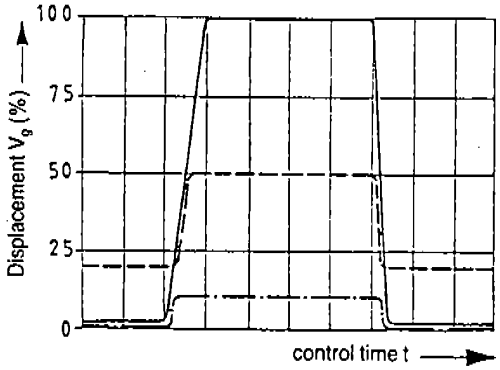


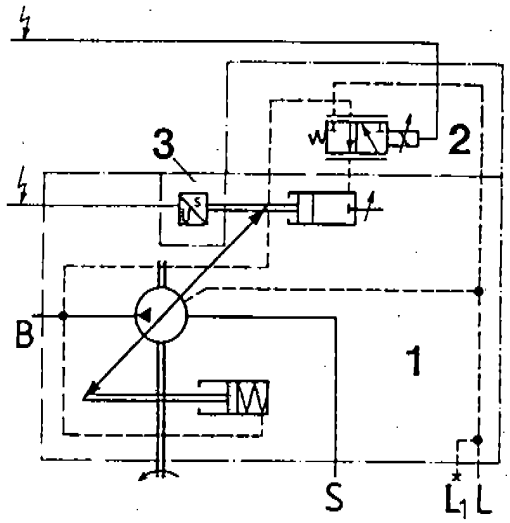
Hysteresis: ≤ ± 1 % of $V_{g\,max}$
Repeatibility: ≤ ± 1 %

Dynamic operating curve

Flow step between two different orifices upon sudden changeover.

Flow/time-curve





Design elements

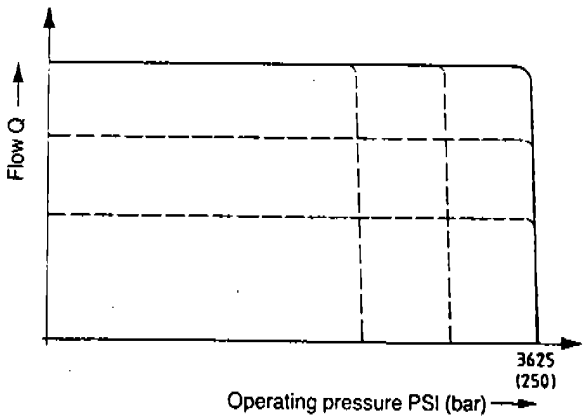
1) AA10VSO with hydraulic control
2) Control valve ENV 202-4-0
3) Inductive positional-transducer (feedback) type IW9-03-01

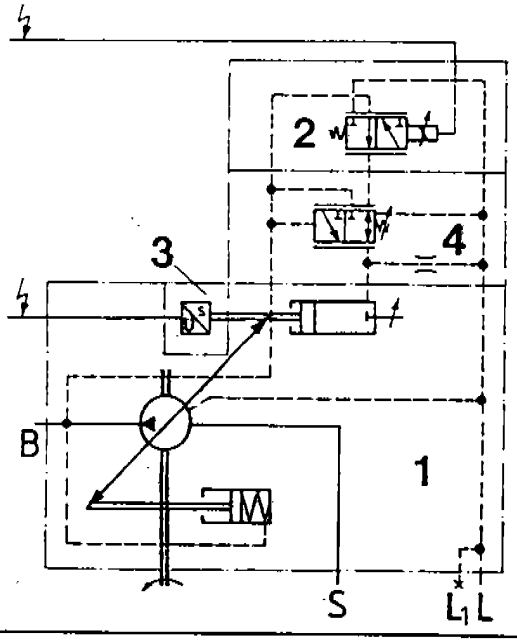
Technical Data

min. required pilot pressure	290 PSI (20 bar)
Control Valve	
current type	DC
supply voltage	24 V
load resistance at 68°F (20°C)	12 Ω
operating time	100%
ambient temperature	...122°F (50°C)
spool temperature	...302°F (150°C)
insulation per DIN 40050	IP 65
isolation class per VDE 0580	F
Inductive positional transducer:	
frequency range	1000 Hz... 5000Hz
inductivity	9.5 mH

Variation: electrical flow control with pressure compensation FED

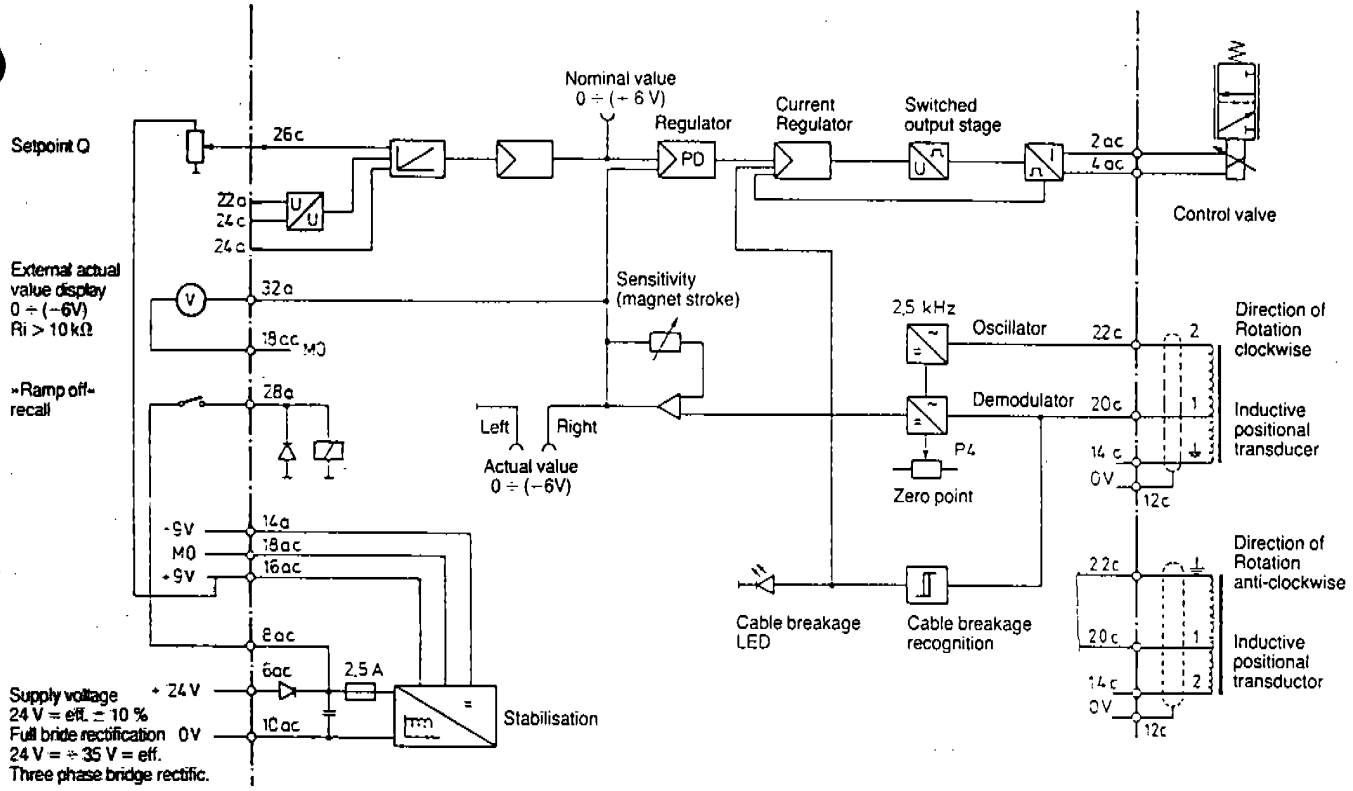
This variation incorporates an additional valve (Pos. 4) into the control, so that a hydraulic pressure compensation function is also available.





Proportional amplifier card VT 5036

(see RA 29957)



- The amplifier may only be unplugged when switched off!
- Measurements to be made with a high resistance meter set on the voltage range!
- Measured (control) zero (M 0) is raised + 9 V with respect to 0 V of the power supply!
- M 0 may NOT be connected to 0 V of the power supply!
- The »earth« sign of the inductive positional transducer may NOT be connected to (0 V) of the supply voltage!
- Radio transmitter may not be placed within 3.6 Ft (1M) of this card!
- Command level inputs may only be switched with dry contact switches suitable for currents of < 1 mA.
- Screen all input lines. Leave one end of the screen open. Connect one end to 0 V of the supply line!
- Do not lay solenoid lines close to power lines!

Through Drive

Axial piston unit AA10VSO may be supplied with a through drive, as indicated in the ordering code page 2.

The Through Drive is determined by index (K01 – K08).

If the combination pumps are assembled in the factory, the ordering code consists of the individual pump codes connected by »+« signs.

Ordering Example:
AA10VSO 71 DR/30 R – PPA12K25 +
AA10VSO 28 DR/30 R – PPA12N00

If the second pump has not to be delivered resp. mounted, the simple type code is sufficient. The coupling, the seal and the fixing screws are a part of the delivery.

We recommend that no more than three individual pumps are coupled in series.

cutaway A – B

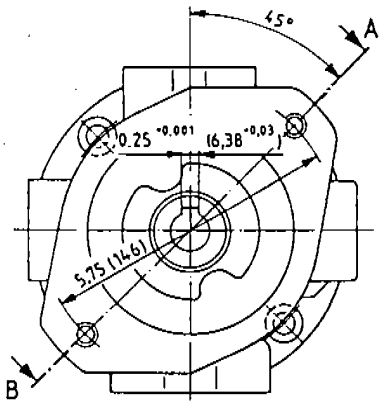
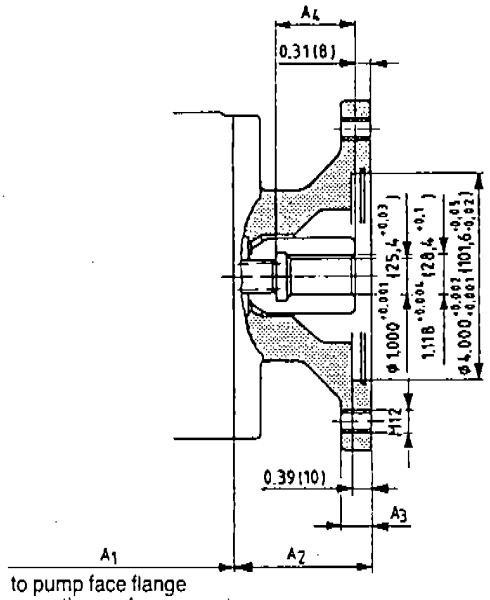
Size	A_1	A_2	A_3	A_4
28	5.268 (133.8)	2.76 (70)	0.59 (15)	1.49 (38)
45	5.858 (148.8)	3.15 (80)	0.55 (14)	1.73 (44)
71	6.960 (176.8)	3.54 (90)	0.71 (18)	2.05 (52)

Mounting of an AA10VSO 45;
order code **K 05**

primary pump sizes 45 and 71



cutaway A – B



Size	A_1	A_2	A_3	A_4
45	5.858 (148.8)	3.15 (80)	0.55 (14)	1.73 (44)
71	6.960 (176.8)	3.54 (90)	0.71 (18)	2.05 (52)

Mounting of an AA10VSO 71;
order code **K 08**
primary pump size 71

cutaway A – B
